Abstract. User Interface eXtensible Markup Language (USIXML) consists of a User Interface Description Language (UIDL) allowing designers to apply a multi-directional development of user interfaces at multiple levels on independence, and not only device independence. In this development paradigm, a user interface can be specified and produced at and from different, and possibly multiple, levels of abstraction while maintaining the mappings between these levels if required. Thus, the development process can be initiated from any level of abstraction and proceed towards obtaining one or many final user interfaces for various contexts of use at other levels of abstraction. In this way, the model-to-model transformation which is the cornerstone of Model-Driven Architecture (MDA) can be supported in multiple configurations, based on composition of three basic transformation types: abstraction, reification, and translation.

Keywords: context-sensitive user interface, device independence, modality independence, model-driven architecture, model-to-model transformation, rendering independence, user interface description language.

1 Introduction

Many User Interface Description Languages (UIDLs) have been introduced so far that addresses different aspects of a User Interface (UI): AUIML, UIML, XAML, XIML, XUL,.... Depending on the perspective, the UIDL may address portability, device independence, support of multiple computing platforms, user-centered design, iterative and incremental development to name a few. This proliferation results in many XML-compliant dialects that are not (yet) largely used and that do not allow interoperability between tools that have been developed around the UIDL. In addition, there has been little or no integration of the various models that not only addresses the needs of traditional Graphical User Interfaces (GUIs) and Multimodal User Interfaces (MUIs) simultaneously. Some UIDLs have been defined for one of them, but not for both. To address the above challenges and others, we have defined USIXML (User Interface eXtensible Markup Language – see www.usixml.org), a UIDL that is characterised by the following original principles:
