Advances In Microbial Physiology Volume 6:

Advances in Microbial Physiology, 1971-09-30 **Advances in Microbial Physiology** **Native Aquatic Bacteria: Enumeration Activity, and Ecology** J. W. Costerton, 1979 Books in Print, 1994 **Microbiological Aspects of Pollution Control** R. Dart, 2012-12-02 The second edition of the *Fundamental Aspects of Pollution Control and Environmental Science 6 Microbiological Aspects of Pollution Control* summarizes the advances in the use of microorganisms to remove pollutants from the environment and to recycle essential materials. It discusses practical aspects such as sewage treatment, the theoretical aspects including the genetics of biodegradation of pesticides and the ways in which the biochemical capabilities of microorganisms can be maximized. Comprised of 11 chapters, this volume begins with an overview of how microorganisms produce chemical pollutants such as mycotoxins and phytotoxins. It then discusses how microorganisms can contribute to air pollution, the effect of air pollutants on microorganisms and the health hazards arising from water borne pathogens. The book also provides the assessment of the quality of surface waters, sewage or sewage effluents and industrial effluents. It explains the microbiological examination of pharmaceutical products. Sewage treatment by methods such as biological filtration, disinfection and recycling of water, eutrophication, thermal pollution, sulfur cycle and waste recovery, oil pollution and the process of biodegradation are also described. Engineers will find this book extremely helpful for the study of the microbiological aspects of pollution and possible solutions. **U.S. Environmental Protection Agency Library System Book Catalog Holdings as of July 1973** United States. Environmental Protection Agency. Library Systems Branch, 1974 Gene Conservation and Exploitation J. Perry Gustafson, Rudi Appels, P. Raven, 2013-06-29 The potato *Solanum tuberosum* L. tuber is a major food source in many countries of the world and subsequently potato has been the target of a good deal of effort directed at engineering disease and herbicide tolerance and improvements in various crop characteristics. Consequently investigations into the regulation of gene expression in tubers is relevant to these endeavours as tubers are the main target organ for modification of gene expression. We have been interested in the regulation of genes in tubers for these reasons. Morphologically tubers are modified stems which have enlarged radially by limited cell division and substantial expansion. At the molecular level tuber development is characterised by a massive increase in starch deposition and the synthesis of a limited number of abundant proteins. These include proteinase inhibitors and a 40kd group of proteins called patatin which are acyl hydrolases. Together these proteins account for over 50% of tuber proteins reviewed by Bevan 1991. The synthesis of these proteins has parallels to the synthesis of other somatic storage proteins especially the VSP proteins of soybean. In both potato and soybean removal of the sink for these proteins, tubers and pods respectively, causes deposition in other tissues Staswick 1990. It is hypothesised that transcriptional control of the genes encoding these proteins is regulated in part by source-sink relationships of metabolites or other factors. In the case of VSPs both amino acid levels and jasmonic acid play a major regulatory role Staswick et al 21st Century Guidebook to Fungi David Moore, Geoffrey D.
