Michael Lord, Martin R. Hartley, 2010-07-20 Many plants produce enzymes collectively known as ribosome inactivating proteins RIPs RIPs catalyze the removal of an adenine residue from a conserved loop in the large ribosomal RNA The adenine residue removed by this depurination is crucial for the binding of elongation factors Ribosomes modified in this way are no longer able to carry out protein synthesis Most RIPs exist as single polypeptides Type 1 RIPs which are largely non toxic to mammalian cells because they are unable to enter them and thus cannot reach their ribosomal substrate In some instances however the RIP forms part of a heterodimer where its partner polypeptide is a lectin Type 2 RIPs These heterodimeric RIPs are able to bind to and enter mammalian cells Their ability to reach and modify ribosomes in target cells means these proteins are some of the most potent cytotoxic poisons found in nature and are widely assumed to play a protective role as part of the host plant's defenses RIPs are able to further damage target cells by inducing apoptosis In addition certain plants produce lectins lacking an RIP component but which are also cytotoxic This book focuses on the structure function and some potential applications of these toxic plant proteins **Natural Products in Plant Pest Management** N. K.

Dubey, 2010-11-24 Overzealous and indiscriminate use of many synthetic pesticides during recent decades in the control of plant pests has resulted in a number of environmental and toxicological problems Reducing the release of synthetic chemicals into the environment requires that alternative sources of chemicals are developed that can be used safely in the management of plant pests Botanical antimicrobials derived from plants are currently recognised as biodegradable systemic eco friendly and non toxic to mammals and are thus considered safe Their modes of action against pests are diverse Natural compounds are well suited to organic food production in industrialised countries and can play greater roles in the protection of food crops in developing countries Some plant based antimicrobials e.g. neem products pyrethroids and essential oils are already used to manage pest populations on a large scale Plant scientists and agriculturists now devote significant attention to discovery and further development and formulation of novel plant products with antimicrobial activity This book is the first to bring together relevant aspects of the basic and applied sciences of natural pesticides and discussed modern trends in the use of natural products in pest management Plant Biotechnology J. Hammond, P. McGarvey, V. Yusibov, 2012-12-06 The

title of this volume Plant Biotechnology New Products and Applications may look a little out of place among previous volumes of Current Topics in Microbiology and Immunology that have focused mostly on issues related to human health and animal biology. However, plant biology has always been of immense and has enjoyed an intimate relationship with practical importance with medicine and other biological sciences for centuries. Increasing scientific specialization and the dramatic advances in the medical and chemical sciences during this century have left many persons with the impression that plant biology and plant biotechnology is important only in relation to the agricultural sciences. This is no longer true. Within the past year, a genetically engineered plant virus has been used to vaccinate and protect against an animal disease (see the chapter by Lomonosoff and Hamilton); the first human trials of a potential transgenic plant-based oral vaccine against cholera have been conducted (see the chapter by Richter and Kipp); and the first human trial of an injectable transgenic plant-derived therapeutic protein is under way (discussed in the chapter by Russell et al). Today, plant biotechnology is being used in new and creative ways to produce therapeutic products for medicine and plastics for industry, as well as new disease- and stress-resistant crops for agriculture.

Recent Advances in the Diagnosis and Management of Plant Diseases L.P. Awasthi, 2015-11-19. This book is a compilation of the most challenging and significant chapters on the diagnosis and management of important bacterial, fungal, viral, viroid, phytoplasma, non-parasitic diseases and various physiological disorders in various crops. The chapters have been contributed by eminent plant pathologists having wide experience of teaching and research on various crops with different types of diseases which cause great economic losses. The book would be very useful for students, teachers, and researchers of plant pathology. This book highlights recent advances made in the development of new types of resistance in host plants and alternative strategies for managing plant diseases to improve food quality and reduce the negative public health impact associated with plant diseases. Having entered into the 21st century, advancements in the Diagnosis of Plant Pathogens and Plant Disease Management need to be closely examined and adequately applied so that newer challenges facing plant pathology could be adequately addressed in attaining food security for the growing population. Substantial advancements have been made in terms of expanding knowledge base of the biology of plant-microbial interactions, disease management strategies and application and practice of Plant Pathology. Application of molecular biology in Plant Pathology has greatly improved our ability to detect plant pathogens and in increasing our understanding of their ecology and epidemiology. Similarly, new technologies and resources have been evolved for the development of sustainable crop protection systems by different control strategies against various pests and pathogens that are important components of the integrated pest management programme. Natural products and chemical compounds discovered as a result of basic research and molecular mechanisms of pathogenesis have led to the development of biorational pesticides. Biological control has been found to be the most significant approach to plant health management during the twentieth century and promises using modern biotechnology to be even more significant in the twenty-first century.
