The Brain Stem of the Cat: A Cytoarchitectonic Atlas with Stereotaxic Coordinates

by ALVIN L. BERMAN, 80 plates, University of Wisconsin Press, Madison, 1968. \$50

This is perhaps the largest and most complete cytoarchitectonic atlas of the cat brain and the only one available in which photographs of sections are present in transverse, sagittal, and horizontal planes. The old Winkler and Potter Atlas (1914) has been a useful guide for many years, but the steady stream of new contributions has caused it to become outdated. The photographic reproductions in this new atlas are superb. The terminology is in English and conforms to that most commonly used by current research workers. Informative legends with reference citations to the current literature are on pages facing the plates. The sagittal and horizontal plates are most welcome and will serve as a valuable guide for investigators in the basic neurological sciences. There is an extensive bibliography of recent studies of the cat brainstem.

There are few criticisms that can be made of this valuable work, except that the atlas is tremendously oversized (18 by 23 in.) and cannot be easily stored in any standard bookcase. The publishers have been lavish in their use of paper, and there are great areas of space not used. Perhaps the large size of the atlas makes it more useful, but it also adds to the cost.

This valuable atlas will be widely used by neuroanatomists and neurophysiologists everywhere.

A Stereotaxic Atlas of the Brain of the Baboon (Papio)

by ROSS DAVIS, M.D., and RONALD D. HUFFMAN, PH.D., 134 pp., ill., University of Texas Press, Austin, 1968. \$20

The preparation of a detailed stereotaxic atlas of the baboon brain indicates that investigators in the neurosciences are finding it necessary to progress to larger nonhuman primates. Although the baboon has not been a common experimental animal, it apparently offers certain definite advantages as a subject for neurological studies.

The authors begin by presenting illustrations and data concerning their stereotaxic apparatus for the baboon. This is followed by photographs of the gross brain and roentgenograms of the skull. The atlas itself consists of about 112 plates, arranged so that photographs of Weil-stained sections face similar photographs of Nissl-stained sections. All sections have been cut in a transverse plane. Structures on the calibrated plates are identified by key letters and the legends are beneath the plates, which are of excellent quality and reveal abundant details. The photographs of Nissl-stained sections, which are of greatest value, are uniformly better than those of Weil-stained sections. The plates of the lower brainstem would be of greater value if they were of complete sections instead of only half-sections. The nomenclature used in areas of the brainstem is questionable for some structures.

The atlas is beautifully prepared and will be most useful to investigators working with large primates.
