Function Models of Noise and Modulation John H. Painter, Someshwar C. Gupta, Jon W. Bayless, 1969 This paper is essentially a presentation of the theory of complex analytic time functions applied to a representation of stochastic and deterministic time processes By using analytic notation noise and modulated signals are represented in the same manner An intuitively satisfying yet mathematically rigorous method of transition from real to analytic processes is given By use of the theory of distributions the rotating vector or phasor method is generalized to arbitrary functions and stochastic processes The advantages of analytic time function notation are exploited to derive correlation and spectral functions for both signal and noise processes The polar and quadrature forms for band pass processes are derived
