Dostal, 2006-11-14 *Mathematicians in Bologna 1861-1960* Salvatore COEN, 2012-05-11 The scientific personalities of Luigi Cremona Eugenio Beltrami Salvatore Pincherle Federico Enriques Beppo Levi Giuseppe Vitali Beniamino Segre and of several other mathematicians who worked in Bologna in the century 1861-1960 are examined by different authors in some cases providing different viewpoints. Most contributions in the volume are historical; they are reproductions of original documents or studies on an original work and its impact on later research. The achievements of other mathematicians are investigated for their present-day importance. *Several Complex Variables* V.G.M. Khenkin, 2012-12-06 In this part we present a survey of mean periodicity phenomena which arise in connection with classical questions in complex analysis, partial differential equations and more generally convolution equations. A common feature of the problem we shall consider is the fact that their solutions depend on techniques and ideas from complex analysis. One finds in this way a remarkable and fruitful interplay between mean periodicity and complex analysis. This is exactly what this part will try to explore. It is probably appropriate to stress the classical flavor of all of our treatment. Even though we shall frequently refer to recent results and the latest theories such as algebraic analysis or the theory of Bernstein-Sato polynomials, it is important to observe that the roots of probably all the problems we discuss here are classical in spirit, since that is the approach we use. For instance, most of Chap. 2 is devoted to far-reaching generalizations of a result dating back to Euler, and it is soon discovered that the key tool for such generalizations was first introduced by Jacobi. As the reader will soon discover, similar arguments can be made for each of the subsequent chapters. Before we give a complete description of our work on a chapter-by-chapter basis, let us make a remark about the list of references. It is quite hard, maybe even impossible, to provide a complete list of references on such a vast topic. Unstable Homotopy from the Stable Point of View J. Milgram, 2006-11-15

The Mathematics of Superoscillations Yakir Aharonov, Fabrizio Colombo, Irene Sabadini, Daniele C. Struppa, Jeff Tollaksen, 2017-04-25 In the past 50 years, quantum physicists have discovered and experimentally demonstrated a phenomenon which they termed superoscillations. Aharonov and his collaborators showed that superoscillations naturally arise when dealing with weak values, a notion that provides a fundamentally different way to regard measurements in quantum physics. From a mathematical point of view, superoscillating functions are a superposition of small Fourier components with a bounded Fourier spectrum which result when appropriately summed in a shift that can be arbitrarily large and well outside the spectrum. The purpose of this work is twofold: on one hand, the authors provide a self-contained survey of the existing literature in order to offer a systematic mathematical approach to superoscillations; on the other hand,

they obtain some new and unexpected results by showing that superoscillating sequences can be seen of as solutions to a large class of convolution equations and can therefore be treated within the theory of analytically uniform spaces In particular the authors will also discuss the persistence of the superoscillatory behavior when superoscillating sequences are taken as initial values of the Schrödinger equation and other equations

Nikolski, 2010-10-06 Together with the companion volume by the same author *Operators Functions and Systems An Easy Reading Volume 1* Hardy Hankel and Toeplitz Mathematical Surveys and Monographs Vol 92 AMS 2002 this unique work combines four major topics of modern analysis and its applications A Hardy classes of holomorphic functions B Spectral theory of Hankel and Toeplitz operators C Function models for linear operators and free interpolations and D Infinite dimensional system theory and signal processing This volume contains Parts C and D Function models for linear operators and free interpolations This is a universal topic and indeed is the most influential operator theory technique in the post spectral theorem era In this book its capacity is tested by solving generalized Carleson type interpolation problems Infinite dimensional system theory and signal processing This topic is the touchstone of the three previously developed techniques The presence of this applied topic in a pure mathematics environment reflects important changes in the mathematical landscape of the last 20 years in that the role of the main consumer and customer of harmonic complex and operator analysis has more and more passed from differential equations scattering theory and probability to control theory and signal processing This and the companion volume are geared toward a wide audience of readers from graduate students to professional mathematicians They develop an elementary approach to the subject while retaining an expert level that can be applied in advanced analysis and selected applications
