Atypical Antipsychotics Bart A. Ellenbroek, Alexander R. Cools, 2012-12-06 The introduction of chlorpromazine in 1953 and haloperidol in 1958 into clinical practice dramatically altered the therapy of schizophrenic patients Although representing by no means a cure for this severe psychiatric illness it allowed for the first time to adequately control the severe hallucinations and delusional beliefs which prevent these patients from leading a more or less independent life Indeed these antipsychotics and the many congeners that were to follow significantly reduced the number of chronic schizophrenic inpatients in psychiatric clinics all over the world However soon after their introduction it became clear that like all other available drugs antipsychotics were by no means miracle drugs In fact two major problems appeared First the antipsychotics had very little effect on the so called negative or defect symptoms like social isolation apathy and anhedonia and secondly virtually all antipsychotics produced a number of side effects of which the neurological often called extra pyramidal side effects were the most troublesome Especially the tardive dyskinesia which occurred in about 15 to 20% of the patients after prolonged treatment represented a major problem in the treatment of schizophrenic patients
