Attention Selective Processes In Vision And Hearing:

Attention Neville Moray, 2017-03-27 The early years of modern experimental psychology were marked by a considerable amount of research on attention and much work was carried out in the laboratories of Wundt Titchener and Helmholtz For various reasons research on attention declined from 1920 until the 1950s Under the early philosophy of behaviourism attention became suspect as a mentalistic concept At the time of original publication in 1969 however much work had been done to quantify and make objective research in this area This was of increasing importance in a world dominated by communication networks and man machine systems in which the human element is the weakest link due to the limits on the rate at which man can handle information Following the publication of Broadbent's Perception and Communication in 1958 work on attention had begun to pour from an ever increasing number of laboratories This book is dedicated to summarising what we knew and attempts to survey the behavioural research in vision and hearing which throw light on how we share and direct attention what are the limits of attention to make some general methodological recommendations to review current theories of the time and to provide a guide to the relevant physiological work As far as possible work on memory has been omitted A bibliography of the major work to the spring of 1969 is included Binocular rivalry: a gateway to consciousness Alexander Maier, Theofanis Panagiotaropoulos, Naotsugu Tsuchiya, Georgios A. Keliris, Brain mind problems like consciousness have been stimulating the interest of philosophers and scientists since the ancient times In the last decades the dramatic development of neuroscience has allowed studying such phenomena at several different levels from single neurons to behavior Binocular rivalry a paradigm dissociating the sensory input from the conscious perception during dichoptic viewing of incongruent images has been a celebrated example of such a tool During the last century empirical research on binocular rivalry contributed the first important insights into the neuronal mechanisms of subjective visual perception Recent advances in brain imaging and electrophysiological recording stimulating techniques as well as novel theoretical concepts and analytical methods could be exploited to expand our knowledge on this fascinating phenomenon of visual perception and elucidate the neural processes underlying visual consciousness This Research Topic aims to bring together contributions that could expand the current frontiers of knowledge in binocular rivalry In particular we would like to focus on reviews hypothesis theory or original research articles that specifically combine novel concepts analytical tools and neurophysiological techniques with binocular rivalry We expect that these contributions will a integrate the vast knowledge already existing in the field b formulate and when possible address questions under the light of recent methodological advances in neuroscience and c provide a benchmark that will stimulate future cutting edge research **Attention and Performance XVI** Daniel Gopher, Toshio Inui, James L. McClelland, Asher Koriati, 1996 The contributions to this volume the sixteenth in the prestigious Attention and Performance series revisit the issue of modularity the idea that many functions are independently realized in specialized autonomous modules Although there is much evidence of modularity in the brain there

is also reason to believe that the outcome of processing across domains depends on the synthesis of a wide range of constraining influences. The twenty four chapters in *Attention and Performance XVI* look at how these influences are integrated in perception, attention, language comprehension and motor control. They consider the mechanisms of information integration in the brain, examine the status of the modularity hypothesis in light of efforts to understand how information integration can be successfully achieved and discuss information integration from the viewpoints of psychophysics, physiology and computational theory. A Bradford Book, Attention and Performance series. *Attention and Performance VIII* R. S. Nickerson, 2014-01-14. First published in 1980. This is a volume of the proceedings of the Eighth International Symposium on Attention and Performance held in Princeton, New Jersey, USA from August 20th to 25th 1978. *Handbook of Perception and Action* Odmar Neumann, A. F. Sanders, 1996-04-04. The *Handbook of Perception and Action* overviews state of the art research in these two areas while also stressing the functional relationships between them. The three volume set will be useful to researchers, technicians, graduate students and final year undergraduates in psychology, developmental psychology, speech and hearing, neuropsychology, neuroscience and physiology. *Basic Processes in Reading* David LaBerge, S. Jay Samuels, 2017-03-27. Originally published in 1977, this volume contains the most recent theoretical views and experimental findings by prominent psychologists at the time working in areas they considered to be most basic to the reading processes. The material will still be of value to people interested in applied and basic aspects of reading as well as those concerned with language processing and information processing in general. The volume divides conveniently into two areas: perception and comprehension. The initial chapters deal with the perceptual processes involved in reading. The second half of the volume delves into the area of comprehension. The interested reader will find a wide variety of topics covered in the volume that reflect the amazingly wide range of cognitive functions that are part of the reading process. *Handbook of Learning and Cognitive Processes (Volume 4)* William K. Estes, 2014-06-20. Originally published in 1976, this is Volume 4 of a series that reflected the current state of the field at the time. In this title, the focus shifts to modern developments in cognitive psychology. The emphasis is primarily on attention and short term memory as these concepts came to be understood in the decade leading up to publication. In addition to presenting the major concepts, the authors outline fundamental theories and methods all in a way that will be readable by anyone with a reasonable scientific background. As the editor notes in the Foreword, each author has taken on the assignment of giving explicit attention to the orienting attitudes and long term goals that tend to shape the overall course of research in his field and to bring out both actual and potential influences and implications with respect to other aspects of the discipline. This volume, as all volumes of the *Handbook*, will be invaluable for those who want an organized picture of the current state of the field as it was at the time. *Neurobiology of Attention* Laurent Itti, Geraint Rees, John K. Tsotsos, 2005-03-31. A key property of neural processing in higher mammals is the ability to focus resources by selectively directing attention to relevant perceptions, thoughts or actions. Research into attention has

grown rapidly over the past two decades as new techniques have become available to study higher brain function in humans non human primates and other mammals Neurobiology of Attention is the first encyclopedic volume to summarize the latest developments in attention research An authoritative collection of over 100 chapters organized into thematic sections provides both broad coverage and access to focused up to date research findings This book presents a state of the art multidisciplinary perspective on psychological physiological and computational approaches to understanding the neurobiology of attention Ideal for students as a reference handbook or for rapid browsing the book has a wide appeal to anybody interested in attention research Contains numerous quick reference articles covering the breadth of investigation into the subject of attention Provides extensive introductory commentary to orient and guide the reader Includes the most recent research results in this field of study

Energetics and Human Information Processing G.M. Hockey,Anthony W.K. Gaillard,Michael Coles,1986-09-30 The central theme of this book is the role of energetical factors in the regulation of human information processing activity This is a restatement of one of the classic problems of psychology that of accounting for motivational or intensive aspects of behaviour as opposed to structural or directional aspects The term energetics was first used in the 1930 s by Freeman Duffy and others following Cannon s energy mobilization view of emotion and motivation The original concept had a limited life probably because of its unnecessary focus on relatively peripheral processes but it provided the foundations for the concepts of arousal and activation which became the popular motivational constructs of the 1950 s and 1960 s Now these too are found wanting The original assumptions of a unitary non specific process based on activation of the brain stem reticular formation have been shown to be misleading Current work in neurobiology has demonstrated evidence of discrete neurotransmitter systems having quite specific information processing functions and central roles in the regulation of behaviour Even the venerable curvilinear relationship between motivation and performance the Yerkes Dodson law has been shown to be at best an unhelpful oversimplification On a different front psychophysiologicals have found complex patterns in the response of different bodily systems to external stressors and to task demands

A Cognitive Theory of Consciousness Bernard J. Baars,1993-07-30 Bernard Baars suggests a way to specify empirical constraints on a theory of consciousness by contrasting well established conscious phenomena with comparable unconscious ones such as stimulus representations known to be preperceptual unattended or habituated By adducing data to show that consciousness is associated with a kind of workplace in the nervous system Baars helps clarify the problem
