Attribute Grammar Inversion and Source-to-source Translation Daniel M. Yellin, 1988-04-15 With the proliferation of computer languages and dialects it is important to create tools to aid in the construction of source to source translators By allowing users to make use of software or data written for another system these tools form an important component in the quest for software reusability After discussing the theoretical and practical issues of attribute grammar inversion this book demonstrates how the technique can be used to build source to source translators This is done by first identifying a common canonical form in which to represent the various source languages and then writing attribute grammars from each source to the canonical form By automatically inverting these attribute grammars one obtains translators from the canonical form back to each source language and by composing the appropriate pairs of translators one obtains source to source translators To prove the feasibility of the inversion approach to source to source translation it has been used to generate translators between the programming languages Pascal and C

Attribute Grammars Pierre Deransart, Martin Jourdan, Bernard Lorho, 1988-08-10 This book treats the problem of formulating models in mathematical programming and thereafter solving the resulting model Particular emphasis is placed on the interaction between the two The topic is viewed from different angles namely linear programming Walter Murray integer programming Ellis Johnson network flows John Mulvey and stochastic programming Roger J B Wets The book will be very useful for any mathematics programmer or operations researcher who works in the field of real world modelling The book is an important part of any university course in modelling particularly in operations research economics and business The book also contains an article on the origins of mathematical programming Alexander Rinnooy Kan This is important reading for anyone interested in the history of the field

Proceedings / Parcella 1988 Gottfried Wolf, 1989-04-19 Proceedings Parallel Computing

Concrete and Abstract Voronoi Diagrams Rolf Klein, 1989-12-20 The Voronoi diagram of a set of sites is a partition of the plane into regions one to each site such that

the region of each site contains all points of the plane that are closer to this site than to the other ones Such partitions are of great importance to computer science and many other fields The challenge is to compute Voronoi diagrams quickly The problem is that their structure depends on the notion of distance and the sort of site In this book the author proposes a unifying approach by introducing abstract Voronoi diagrams These are based on the concept of bisecting curves which are required to have some simple properties that are actually possessed by most bisectors of concrete Voronoi diagrams Abstract Voronoi diagrams can be computed efficiently and there exists a worst case efficient algorithm of divide and conquer type that applies to all abstract Voronoi diagrams satisfying a certain constraint The author shows that this constraint is fulfilled by the concrete diagrams based on large classes of metrics in the plane

Recent Issues in Pattern Analysis and

Recognition Virginio Cantoni,Reiner Creutzburg,Stefano Levialdi,Gottfried Wolf,1989-12-20 This book offers readers a broad view of research in some Western and Eastern European countries on pattern and signal analysis and on coding handling and measurement of images It is a selection of refereed papers from two sources first a satellite conference within the biannual International Conference on Pattern Recognition held in Rome November 14 17 1988 and second work done at the International Basic Laboratory on Image Processing and Computer Graphics Berlin GDR The papers are grouped into three sections The first section contains new proposals for the specific computation of particular features of digital images and the second section is devoted to the introduction and testing of general approaches to the solution of problems met in digital geometry image coding feature extraction and object classification The third section illustrates some recent practical results obtained on real images specifically in character and speech recognition as well as in biomedicine All the techniques illustrated in this book will find direct application in the near future This book should interest and stimulate the reader provoke new thoughts and encourage further research in this widely appealing field
