Standard Guide for Using Indoor Carbon Dioxide Concentrations to Evaluate Indoor Air Quality and Ventilation¹

This standard is issued under the fixed designation D 6245; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This guide describes how measured values of indoor carbon dioxide (CO_2) concentrations can be used in evaluations of indoor air quality and building ventilation.

1.2 This guide describes the determination of CO_2 generation rates from people as a function of body size and level of physical activity.

1.3 This guide describes the experimentally-determined relationship between CO_2 concentrations and the acceptability of a space in terms of human body odor.

1.4 This guide describes the following uses of indoor CO_2 concentrations to evaluate building ventilation—mass balance analysis to determine the percent outdoor air intake at an air handler, the tracer gas decay technique to estimate whole building air change rates, and the constant injection tracer gas technique at equilibrium to estimate whole building air change rates.

1.5 This guide discusses the use of continuous monitoring of indoor and outdoor CO_2 concentrations as a means of evaluating building ventilation and indoor air quality.

1.6 This guide discusses some concentration measurement issues, but it does not include or recommend a method for measuring CO_2 concentrations.

1.7 This guide does not address the use of indoor CO_2 to control outdoor air intake rates.

1.8 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

3. Terminology

3.1 **Definitions**—For definitions and terms used in this guide, refer to Terminology D 1356.

3.2 Definitions of Terms Specific to This Standard:

3.2.1 **air change rate, n** —the total volume of air passing through a zone to and from the outdoors per unit time, divided by the volume of the zone (s^{-1} , h^{-1}).⁴

3.2.2 **bioeffluents, n** —gases emitted by people as a product of their metabolism that can result in unpleasant odors.

3.2.3 **single-zone, n** —an indoor space, or group of spaces, wherein the CO_2 concentration is uniform and that only exchanges air with the outdoors.

4. Summary of Guide

4.1 When investigating indoor air quality and building ventilation, a number of tools are available to understand the building being studied. One such tool is the measurement and interpretation of indoor and outdoor CO_2 concentrations. Using CO_2 concentrations to evaluate building indoor air quality and ventilation requires the proper use of the procedures involved, as well as consideration of several factors related to building and ventilation system configuration, occupancy patterns, non-occupant CO_2 sources, time and location of air sampling, and instrumentation for concentration measurement. This guide discusses ways in which CO_2 concentrations can be used to evaluate building indoor air quality and ventilation.

4.2 Section 6 discusses the rate at which people generate CO_2 and the factors that affect this rate.

4.3 Section 7 discusses the use of indoor concentrations of CO_2 as an indicator of the acceptability of a space in terms of perceptions of human body odor.

Astm Standards On Indoor Air Quality 2002:

Indoor Air Pollution Peter Pluschke, 2004-09-27 Indoor Air Pollution has become a major topic in environmental research and health. Most people spend more than 80% of their time in buildings and are exposed to a broad range of pollutants from indoor sources such as building materials, furniture, carpets and textiles, heating and cooking, household and consumer products etc. The volume provides a comprehensive review of the major indoor air pollutants: volatile organic compounds, biocides, indoor particles and fibres, combustion products and micro organisms and their metabolites. Sources and sinks of air pollutants in indoor environments and their chemistry are distinctly different from ambient air pollution even though the latter may influence indoor air quality. Adsorption and desorption processes, the pollutant source dynamics, gas phase reactions and kinetics, including the fate and final chemical destiny of chemically unstable intermediate compounds are topics of scientific research as well as the evaluation of their sensory impact and irritation potential. Guidelines for assessing indoor pollution and a broad range of analytical methods have been recently developed and are reviewed by internationally renowned scientists. The specific characteristics of indoor air pollution in developing countries due to the widespread use of open fires for cooking, heating and lighting are analysed as well as the Chinese strategies to address the growing pollution problems by air pollution in its modern building stock. Popendorf, 2006-05-15 Do you need guidelines for choosing a substitute organic solvent that is safer to use? Do you need an effective, cheap but perhaps temporary way to reduce exposures before you can convince your employer to spend money on a long term or more reliable solution? Do you need information about local exhaust ventilation or personal protective equipment like respirators and gloves? Industrial Hygiene Control of Airborne Chemical Hazards provides the answers to these questions and more. Science based and quantitative, the book introduces methods for controlling exposures in diverse settings, focusing squarely on airborne chemical hazards. It bridges the gap between existing knowledge of physical principles and their modern application with a wealth of recommendations, techniques and tools accumulated by generations of IH practitioners to control chemical hazards. Provides a unique comprehensive tool for facing the challenges of controlling chemical hazards in the workplace. Although William Popendorf has written the book at a fundamental level, he assumes the reader has some experience in science and math as well as in manufacturing or other work settings with chemical hazards but is inexperienced in the selection, design, implementation or management of chemical exposure control systems. Where the book is quantitative, of course, there are lots of formulae, but in general, the author avoids vague notation and long derivations.

Chemistry, Emission Control, Radioactive Pollution and Indoor Air Quality Nicolas Mazzeo, 2011-07-27 The atmosphere may be our most precious resource Accordingly the balance between its use and protection is a high priority for our civilization While many of us would consider air pollution to be an issue that the modern world has resolved to a greater extent it still appears to have considerable influence on the global environment In many countries with ambitious economic growth targets the acceptable levels of air pollution have been transgressed Serious respiratory disease related problems have been identified with both indoor and outdoor pollution throughout the world The 25 chapters of this book deal with several air pollution issues grouped into the following sections a air pollution chemistry b air pollutant emission control c radioactive pollution and d indoor air quality Damp Indoor Spaces and Health Committee on Damp Indoor Spaces and Health, 2004-08-31 Almost all homes apartments and commercial buildings will experience leaks flooding or other forms of excessive indoor dampness at some point Not only is excessive dampness a health problem by itself it also contributes to several other potentially problematic types of situations Molds and other microbial agents favor damp indoor environments and excess moisture may initiate the release of chemical emissions from damaged building materials and furnishings This new book from the Institute of Medicine examines the health impact of exposures resulting from damp indoor environments and offers recommendations for public health interventions Damp Indoor Spaces and Health covers a broad range of topics The book not only examines the relationship between damp or moldy indoor environments and adverse health outcomes but also discusses how and where buildings get wet how dampness influences microbial growth and chemical emissions ways to prevent and remediate dampness and elements of a public health response to the issues A comprehensive literature review finds sufficient evidence of an association between damp indoor environments and some upper respiratory tract symptoms coughing wheezing and asthma symptoms in sensitized persons This important book will be of interest to a wide ranging audience of science health engineering and building professionals government officials and members of the public
