Laurie A. Garrow,2016-05-23 In recent years airline practitioners and academics have started to explore new ways to model airline passenger demand using discrete choice methods This book provides an introduction to discrete choice models and uses extensive examples to illustrate how these models have been used in the airline industry These examples span network planning revenue management and pricing applications Numerous examples of fundamental logit modeling concepts are covered in the text including probability calculations value of time calculations elasticity calculations nested and non nested likelihood ratio tests etc The core chapters of the book are written at a level appropriate for airline practitioners and graduate students with operations research or travel demand modeling backgrounds Given the majority of discrete choice modeling advancements in transportation evolved from urban travel demand studies the introduction first orients readers from different backgrounds by highlighting major distinctions between aviation and urban travel demand studies This is followed by an in depth treatment of two of the most common discrete choice models namely the multinomial and nested logit models More advanced discrete choice models are covered including mixed logit models and generalized extreme value models that belong to the generalized nested logit class and or the network generalized extreme value class An emphasis is placed on highlighting open research questions associated with these models that will be of particular interest to operations research students Practical modeling issues related to data and estimation software are also addressed and an extensive modeling exercise focused on the interpretation and application of statistical tests used to guide the selection of a preferred model specification is included the modeling exercise uses itinerary choice data from a major airline The text concludes with a discussion of on going customer modeling research in aviation Discrete Choice Modelling and Air Travel Demand is enriched by a comprehensive set of technical appendices that will be of particular interest to advanced students of discrete choice modeling theory The appendices also include detailed proofs of the multinomial and nested logit models and derivations of measures used to represent competition among alternatives namely correlation direct elasticities and cross elasticities **Air travel and health**

for individuals with existing risk factors and the Committee urges the Government to continue to support this project The Committee also believes that further investigation into the effects of fumes on pilots and others should be continued The Committee has set out a number of recommendations including that jet lag should be studied as a confounding effect of DVT that the Government should explore ways to increase the research capacity in aviation health that the CAA should implement the recommendations of its own research into aircraft seating standards and increase the minimum seat pitch to at least 28 2 inches the Government should also review the level of air passenger duty levied on premium economy seating also that the Government and airlines advise passengers on the proven benefits of good hygiene in the reduction of disease transmission and that as part of their contingency plans airlines that are flying from areas affected by a pandemic should provide bacterial wipes to passengers that the Government and the AHU work together with airlines and others in providing consistent air travel advice to passengers on the risks associated with self medicating with the intention of preventing DVT
