

Types of light:

Light is of two types natural and artificial. Artificial light is man made light and is produced by electrical devices like bulbs, lamps etc. Natural light is not man made like the sun which is the main source of natural light on the earth.

How light travels:

Light travels only in a straight line because when it bumps into a non transparent object it creates a shadow. Light can be bounced at an angle. The second rule of light is that the angle of incidence is equal to the angle of reflection.

Light

Rainbows:

They are formed when the sunlight passes through the rain drops which act like prisms and a rainbow is formed with seven colors which are Red, Orange, Yellow, Green, Blue, Indigo and Violet.

Light travels in waves:

Light travels in waves, these waves can be big or small. The smaller the light waves the faster it travels. At its full speed light can travel at 299,792 KM per second and is faster than sound.

Light traveling time between the sun and earth:

Light is so fast that it only 8 minutes for light from the sun to reach the earth, the distance between the sun and earth is 152 million kilometres away and would take a spacecraft 19 years to travel to it.
