Branching Solutions To One-dimensional Variational Problems Alexandr Ivanov,Alexei Avgustinovich Tuzhilin,2001-01-17 This book deals with the new class of one dimensional variational problems the problems with branching solutions Instead of extreme curves mappings of a segment to a manifold we investigate extreme networks which are mappings of graphs one dimensional cell complexes to a manifold Various applications of the approach are presented such as several generalizations of the famous Steiner problem of finding the shortest network spanning given points of the plane

Branching Solutions to One-dimensional Variational Problems Alexander O. Ivanov,A. A. Approximation Pablo Pedregal,2017-09-07 This book provides a basic initial resource introducing science and engineering students to the field of optimization It covers three main areas mathematical programming calculus of variations and optimal control highlighting the ideas and concepts and offering insights into the importance of optimality conditions in each area It also systematically presents affordable approximation methods Exercises at various levels have been included to support the learning process **The Nature of Motive Force** Achintya Kumar Pramanick,2014-08-23 In this monograph Prof

Pramanick explicates the law of motive force a fundamental law of nature that can be observed and appreciated as an addition to the existing laws of thermodynamics This unmistakable and remarkable tendency of nature is equally applicable to all other branches of studies He first conceptualized the law of motive force in 1989 when he was an undergraduate student Here he reports various applications of the law in the area of thermodynamics heat transfer fluid mechanics and solid mechanics and shows how it is possible to solve analytically century old unsolved problems through its application This book offers a comprehensive account of the law and its relation to other laws and principles such as the generalized conservation principle variational formulation Fermat s principle Bejan s constructal law entropy generation minimization Bejan s method of intersecting asymptotes and equipartition principle Furthermore the author addresses some interrelated fundamental problems of contemporary interest especially to thermodynamicists by combining analytical methods physical reasoning and the proposed law of motive force This foundational work is a valuable reading for both students and researchers in exact as well as non exact sciences and at the same time a pleasant learning experience for the novice **The Steiner Ratio**

Dietmar Cieslik,2013-03-14 Steiner s Problem concerns finding a shortest interconnecting network for a finite set of points in a metric space A solution must be a tree which is called a Steiner Minimal Tree SMT and may contain vertices different from the points which are to be connected Steiner s Problem is one of the most famous combinatorial geometrical problems but

unfortunately it is very difficult in terms of combinatorial structure as well as computational complexity However if only a Minimum Spanning Tree MST without additional vertices in the interconnecting network is sought then it is simple to solve So it is of interest to know what the error is if an MST is constructed instead of an SMT The worst case for this ratio running over all finite sets is called the Steiner ratio of the space The book concentrates on investigating the Steiner ratio The goal is to determine or at least estimate the Steiner ratio for many different metric spaces The author shows that the description of the Steiner ratio contains many questions from geometry optimization and graph theory Audience Researchers in network design applied optimization and design of algorithms

Differential Geometric Structures and Applications Vladimir Rovenski, Paweł Walczak, Robert Wolak, 2024-03-15 This proceedings contains a collection of selected peer reviewed contributions from the 4th International Workshop Differential Geometric Structures and Applications held in Haifa Israel from May 10 13 2023 The papers included in this volume showcase the latest advancements in modern geometry and interdisciplinary applications in fields ranging from mathematical physics to biology Since 2008 this workshop series has provided a platform for researchers in pure and applied mathematics including students to engage in discussions and explore the frontiers of modern geometry Previous workshops in the series have focused on topics such as Reconstruction of Geometrical Objects Using Symbolic Computations 2008 Geometry and Symbolic Computations 2013 and Geometric Structures and Interdisciplinary Applications 2018

Shortest Connectivity Dietmar Cieslik, 2004-11-19 The aim in this graduate level text is to outline the key mathematical concepts that underpin these important questions in applied mathematics These concepts involve discrete mathematics particularly graph theory optimization computer science and several ideas in biology

Phase Optimization Problems Olena Bulatsyk, Boris Z. Katsenelenbaum, Yury P. Topolyuk, Nikolai N. Voitovich, 2010-03-09 This is the only book available in English language to consider inverse and optimization problems in which phase field distributions are used as optimizing functions The mathematical technique used relates to nonlinear integral equations with numerical methods developed and applied to concrete problems Written by a team of outstanding and renowned experts in the field this monograph will appeal to all those dealing with the investigation design and optimization of electromagnetic and acoustic radiating and transmitting devices and systems while also being of interest to mathematicians working on the theory of nonlinear integral equations

Topological Methods for Variational Problems with Symmetries Thomas Bartsch, 2006-11-15 Symmetry has a strong impact on the number and shape of solutions to variational problems This has been observed for instance in the search for periodic solutions of Hamiltonian systems or of the nonlinear wave equation when one is interested in elliptic equations on symmetric domains or in the corresponding semiflows and when one is looking for special solutions of these problems This book is concerned with Lusternik Schnirelmann theory and Morse Conley theory for group invariant functionals These topological methods are developed in detail with new calculations of the equivariant Lusternik Schnirelmann category and versions of the Borsuk Ulam theorem for very general classes of

symmetry groups The Morse Conley theory is applied to bifurcation problems in particular to the bifurcation of steady states and heteroclinic orbits of $O(3)$ symmetric flows and to the existence of periodic solutions near equilibria of symmetric Hamiltonian systems Some familiarity with the usual minimax theory and basic algebraic topology is assumed

Discrete Geometry and Algebraic Combinatorics Alexander Barg, Oleg R. Musin, 2014-08-28 This volume contains the proceedings of the AMS Special Session on Discrete Geometry and Algebraic Combinatorics held on January 11 2013 in San Diego California The collection of articles in this volume is devoted to packings of metric spaces and related questions and contains new results as well as surveys of some areas of discrete geometry This volume consists of papers on combinatorics of transportation polytopes including results on the diameter of graphs of such polytopes the generalized Steiner problem and related topics of the minimal fillings theory a survey of distance graphs and graphs of diameters and a group of papers on applications of algebraic combinatorics to packings of metric spaces including sphere packings and topics in coding theory In particular this volume presents a new approach to duality in sphere packing based on the Poisson summation formula applications of semidefinite programming to spherical codes and equiangular lines new results in list decoding of a family of algebraic codes and constructions of bent and semi bent functions
