528 Does Blood Alcohol Content Influence Serum Chemistry Laboratory Assessments in Trauma Patients? An Exploratory Study

Background: Acute alcohol intoxication continues to be one of the most common presenting findings at trauma centers around the country. Despite this, information regarding the effect of elevated blood alcohol levels on basic serum chemistry characteristics continues to be limited. The aim of this study was to determine the effect of blood alcohol concentration (BAC) on the behavior of key components of the serum chemistry or basic metabolic panel (BMP). We hypothesized that increasing BAC would be associated with significant changes in BMP subcomponents.

Methods: Institutional registry at our Level I Trauma Center was queried between August 1998 and June 2015 for all trauma patients for whom BAC was recorded. Other collected data points included patient demographics, injury mechanism/severity information, BMP, serum lactate, and base deficit. Serum chemistry data were constrained across pre-defined BAC strata (0.10%). Statistical comparisons were performed using analysis of covariance (ANCOVA) with corrections performed for patient demographics and injury characteristics. Statistical significance was set at $p < 0.05$.

Results: A total of 1901 patients were included in the current analysis (mean age 41 years, 71% male, mean ISS 12). Percentage change in BMP components between those patients with BAC 0.10% was determined to be: Sodium +0.5%, Potassium -3.7%, Chloride +0.6%, Bicarbonate -6.0%, BUN -23.3%, Creatinine -41.9%, and Glucose +11.0%. In addition, there was a +64.1% change in lactate and a +228.4% change in base excess between low BAC (0.10%) groups. Percentage change between the two groups was statistically significant in all parameters studied.

Conclusions: Consistent with our initial hypothesis, we found that all serum chemistry parameters demonstrated significant changes with increasing BAC. Largest differences were seen in serum lactic acid and base excess determinations, followed by BUN, creatinine, and glucose. These findings are generally consistent with widely accepted beliefs regarding the effect of acute alcohol intoxication on serum chemistry values. Our study provides a descriptive foundation for future research in this important area.
