

Effects of Acute Exercise on Executive Function in Children with ADHD

Introduction

Introduction

Executive function (EF), or the capacity to plan and carry out behaviour to achieve a goal, is critical for self-directed behaviour and independence. Increasing evidence has repeatedly demonstrated that individuals with ADHD exhibit compromised EF from childhood through adulthood (see reviews by Denckhoff & Ouseoff, 1994; Willcutt, Doyle, Nigg, Faraone, & Pennington, 2005). However, recent research suggests that aerobic exercise may enhance children's executive function. This finding is of particular interest for children with ADHD who have trouble with executive function. Although pharmacological and behavioural interventions can help children with ADHD improve their cognitive processes, many parents prefer not to use medication as a treatment for their child with ADHD (Faraone, Hennes, & Cramer, 2001; Faraone, Hennes, & Berman, 1995). Moreover, some children experience notable side effects from medication (Swanson et al., 2006; Wyal et al., 2006). Consequently, the need to find alternative interventions to modulate cognition in individuals with ADHD continues to be a growing area of research. The purpose of this literature review is to examine the impact of acute aerobic exercise on the executive function of children with ADHD. To examine the effectiveness of acute aerobic exercise on improving executive function in children, empirical neuropsychological studies published in the past 7 years are reviewed. Overall, physical exercise has been found to be an effective intervention to enhance EF in children with ADHD. First, this review defines ADHD and executive function. Second, findings from empirical studies are examined to determine the effectiveness of acute aerobic exercise on EF in children with ADHD. Finally, implications of exercise for children's development and themes for future research are discussed.
