Vinoth Kumar, 2023-05-10 This contributed volume comprises of detailed chapters covering the biotechnological approaches employed for the removal of toxic recalcitrant xenobiotics such as petroleum hydrocarbons textile dyes microplastics and synthetic polymers that pose serious threat to the environment It also includes the waste to energy conversion strategies that provides a deep insight on the need for waste circular economy for different developing countries and its implication on sustainable development goals such as SDG 12 responsible consumption and production SDG 14 Life below water and SDG 15 Life on land Emerging pollutants sourced from both industries and anthropogenic activity have created havoc in recent years for public health and destruction of biodiversity at multiple levels The alarming increase in the global population and rapid industrialization might aggravate the problems associated with these hazardous pollutants in near future Effluent from different industries may contain high amounts of xenobiotic hazardous contaminants such as dyes hydrocarbons synthetic surfactants microplastics etc Industries and public sewers handling such waste streams are facing a plethora of challenges in the effluent treatment and solid waste disposal due to various factors that start from production to adoption of appropriate technologies Therefore there is an immediate circumvention of bottlenecks through sustainable mitigation strategies This book is of interest to teachers researchers climate change scientists capacity builders and policymakers Also the book serves as additional reading material for undergraduate and graduate students of agriculture forestry ecology soil science and environmental sciences National and international agricultural scientists policy makers also find this to be a useful read

Analysis of Selected Enhancements for Soil Vapor Extraction, 1997 This report provides an engineering analysis of and status report on selected enhancements for soil vapor extraction SVE treatment technologies The report is intended to assist project managers considering an SVE treatment system by providing them with an up to date status of enhancement technologies an evaluation of each technology's applicability to various site conditions a presentation of cost and performance information a list of vendors specializing in the technologies a discussion of relative strengths and limitations of the technologies recommendations to keep in mind when considering the enhancements and a compilation of references The performance of an SVE system depends on properties of both the contaminants and the soil SVE is generally applicable to compounds with a vapor pressure of greater than 1 millimeter of mercury at 20°C and a Henry's Law constant of greater than 100 atmospheres per mole fraction SVE is most effective at sites with relatively permeable contaminated soil and with saturated hydraulic conductivities of greater than 1×10^{-3} or 1×10^{-2} centimeter per second cm/s SVE by itself does not effectively remove contaminants in saturated soil However SVE can be used as an integral part of some treatment schemes that treat both groundwater and the overlying vadose zone Enhancement technologies should be considered when contaminant or soil characteristics limit the effectiveness of SVE or when contaminants are present in

saturated soil The five enhancement technologies covered in this report are as follows and are described in the following subsections Air Sparging Dual phase Extraction Directional Drilling Pneumatic and Hydraulic Fracturing Thermal Enhancement

Applied Bioremediation and Phytoremediation Ajay Singh, Owen P. Ward, 2013-06-29 The huge expansion of the chemical and petroleum industries in the twentieth century has resulted in the production of a vast array of chemical compounds and materials that have transformed our lives The associated large scale manufacturing processing and handling activities have caused a serious deterioration in environmental quality and created threats to human health These negative impacts have led to responses and regulations requiring remedial action in support of environmental sustainability of biotechnological methods through bioremediation Application has gained prominence as an option for soil remediation methods Bioremediation is a multidisciplinary approach where biologists chemists soil scientists and engineers work as team to develop and implement remediation processes Bioremediation has now been used successfully to remediate many petroleum contaminated sites However there are as yet no commercial technologies commonly used to remediate the most recalcitrant contaminants Nevertheless bioremediation is a rapidly advancing field and new bio based remedial technologies are continuing to emerge
