Agency In Action The Practical Rational Agency Machine:

Agency in Action S. Coval, P.G. Campbell, 2012-12-06 This series will include monographs and collections of studies devoted to the investigation and exploration of knowledge information and data processing systems of all kinds no matter whether human other animal or machine Its scope is intended to span the full range of interests from classical problems in the philosophy of mind and philosophical psychology through issues in cognitive psychology and sociobiology concerning the mental capabilities of other species to ideas related to artificial intelligence and to computer science While primary emphasis will be placed upon theoretical conceptual and epistemological aspects of these problems and domains empirical experimental and methodological studies will also appear from time to time Sam Coval and Peter Campbell provide a painstaking and distinctive analysis of the nature of action and agency They introduce a conception of acts which encompasses the purposes that motivate them the beliefs on the basis of which they are undertaken and the effects that they bring about They compare and contrast their account with ones advanced by Davidson Brand Searle Danto and other while elaborating its consequences for understanding the nature of alibis mistakes accidents inadvertence and the like The valuable diagrams and the discussion of the software program they have developed which implements their theory amply displays the potential of combining philosophy and AI with law and other disciplines focused upon agency J H F

Prerational Intelligence Holk Cruse, Jeffrey Dean, Helge Ritter, 2000 The focus of prerational intelligence is on the way animals and artificial systems utilize information about their surroundings in order to behave intelligently the premise is that logic and symbolic reasoning are neither necessary nor possibly sufficient Experts in the fields of biology psychology robotics AI mathematics engineering computer science and philosophy review the evidence that intelligent behaviour can arise in systems of simple agents interacting according to simple rules that self organization and interaction with the environment are critical and that quick approximations may replace logical analyses It is argued that a better understanding of the intelligence inherent in procedure like those illustrated will eventually shed light on how rational intelligence is realised in humans Readership Scientifically literate general readers and scientists in all fields interested in understanding and duplicating biological intelligence Prerational Intelligence: Adaptive Behavior and Intelligent Systems Without Symbols and Logic , Volume 1, Volume 2 Prerational Intelligence: Interdisciplinary Perspectives on the Behavior of Natural and Artificial Systems, Volume 3 Holk Cruse, Jeffrey Dean, Helge Ritter, 2013-11-11 The present book is the product of conferences held in Bielefeld at the Center for interdisciplinary Studies ZiF in connection with a year long ZiF Research Group with the theme Prerational intelligence The premise explored by the research group is that traditional notions of intelligent behavior which form the basis for much work in artificial intelligence and cognitive science presuppose many basic capabilities which are not trivial as more recent work in robotics and neuroscience has shown and that these capabilities may be best understood as emerging from interaction and cooperation in systems of simple agents elements that accept inputs from and

act upon their surroundings The main focus is on the way animals and artificial systems process information about their surroundings in order to move and act adaptively The analysis of the collective properties of systems of interacting agents however is a problem that occurs repeatedly in many disciplines Therefore contributions from a wide variety of areas have been included in order to obtain a broad overview of phenomena that demonstrate complexity arising from simple interactions or can be described as adaptive behavior arising from the collective action of groups of agents To this end we have invited contributions on topics ranging from the development of complex structures and functions in systems ranging from cellular automata genetic codes and neural connectivity to social behavior and evolution Additional contributions discuss traditional concepts of intelligence and adaptive behavior 1 **Superminds** Selmer Bringsjord, M.

Zenzen, 2012-12-06 This is the first book length presentation and defense of a new theory of human and machine cognition according to which human persons are superminds Superminds are capable of processing information not only at and below the level of Turing machines standard computers but above that level the Turing Limit as information processing devices that have not yet been and perhaps can never be built but have been mathematically specified these devices are known as super Turing machines or hypercomputers Superminds as explained herein also have properties no machine whether above or below the Turing Limit can have The present book is the third and pivotal volume in Bringsjord's supermind quartet the first two books were *What Robots Can* and *Can't Be* Kluwer and *AI and Literary Creativity* Lawrence Erlbaum The final chapter of this book offers eight prescriptions for the concrete practice of AI and cognitive science in light of the fact that we are superminds **Computers and Cognition: Why Minds are not Machines** J.H. Fetzer, 2013-03-07 An important collection

of studies providing a fresh and original perspective on the nature of mind including thoughtful and detailed arguments that explain why the prevailing paradigm the computational conception of language and mentality can no longer be sustained An alternative approach is advanced inspired by the work of Charles S Peirce according to which minds are sign using or semiotic systems which in turn generates distinctions between different kinds of minds and overcomes problems that burden more familiar alternatives Unlike conceptions of minds as machines this novel approach has obvious evolutionary implications where differences in semiotic abilities tend to distinguish the species From this point of view the scope and limits of computer and AI systems can be more adequately appraised and alternative accounts of consciousness and cognition can be more thoroughly criticised Readership Intermediate and advanced students of computer science AI cognitive science and all students of the philosophy of the mind *Mental Symbols* P. Novak, 2012-12-06 *Mental Symbols* is an essay on mind and meaning on the biological implementation of mental symbols on the architecture of mind and on the correct construal of logical properties and relations of symbols including implication and inference The book argues against the main contemporary trends in the cognitive sciences preferring rather the classical early modern tradition The author looks at some logical paradoxes in the light of that tradition and offers a novel answer to the problem of the biological implementation of

the mind in the brain **Behavior and Its Causes** T.L. Smith, 2013-04-17 This series will include monographs and collections of studies devoted to the investigation and exploration of knowledge information and data processing systems of all kinds no matter whether human other animal or machine Its scope is intended to span the full range of interests from classical problems in the philosophy of mind and philosophical psychology through issues in cognitive psychology and sociobiology concerning the mental capabilities of other species to ideas related to artificial intelligence and computer science While primary emphasis will be placed upon theoretical conceptual and epistemological aspects of these problems and domains empirical experimental and methodological studies will also appear from time to time While most philosophers and psychologists tend to believe that the rise of cognitive psychology has occurred concomitant with the decline of operant psychology Terry L Smith contends that nothing could be further from the truth He maintains that operant psychology has discovered and continues to discover reasonably well confirmed causal principles of intentional behavior which go beyond what cognitive psychology can provide while cognitive psychology in turn has the potential to supply analyses and explanations that account for them Smith thus advances a surprising but nonetheless illuminating perspective for appreciating the place of operant conditioning within the discipline of psychology in this rich and fascinating work J H F

Knowing and the Mystique of Logic and Rules P. Naur, 2013-03-14 Human knowing is examined as it emerges from classical empirical psychology with its ramifications into language computing science and scholarship While the discussion takes empirical support from a wide range claims for the significance of logic and rules are challenged throughout Highlights of the discussion knowing is a matter of habits or dispositions that guide the person's stream of consciousness rules of language have no significance in language production and understanding being descriptions of linguistic styles statements that may be true or false enter into ordinary linguistic activity not as elements of messages but merely as summaries of situations with a view to action in computer programming the significance of logic proof and formalized description is incidental and subject to the programmer's personality analysis of computer modelling of the mental activity shows that in describing human knowing the computer is irrelevant in accounting for the scholarly scientific activity logic and rules are impotent a novel theory scholarship and science have coherent descriptions as their core The discussion addresses questions that are basic to advanced applications of computers and to students of language and science **Artificial Intelligence**

and Creativity T. Dartnall, 2013-04-17 Creativity is one of the least understood aspects of intelligence and is often seen as intuitive and not susceptible to rational enquiry Recently however there has been a resurgence of interest in the area principally in artificial intelligence and cognitive science but also in psychology philosophy computer science logic mathematics sociology and architecture and design This volume brings this work together and provides an overview of this rapidly developing field It addresses a range of issues Can computers be creative Can they help us to understand human creativity How can artificial intelligence AI enhance human creativity How in particular can it contribute to the sciences of

the artificial such as design Does the new wave of AI connectionism geneticism and artificial life offer more promise in these areas than classical symbol handling AI What would the implications be for AI and cognitive science if computers could not be creative These issues are explored in five interrelated parts each of which is introduced and explained by a leading figure in the field Prologue Margaret Boden Part I Foundational Issues Terry Dartnall Part II Creativity and Cognition Graeme S Halford and Robert Levinson Part III Creativity and Connectionism Chris Thornton Part IV Creativity and Design John Gero Part V Human Creativity Enhancement Ernest Edmonds Epilogue Douglas Hofstadter For researchers in AI cognitive science computer science philosophy psychology mathematics logic sociology and architecture and design and anyone interested in the rapidly growing field of artificial intelligence and creativity **Metaphor and Cognition** B. Indurkha, 2013-03-09

Many metaphors go beyond pointing to the existing similarities between two objects they create the similarities Such metaphors which have been relegated to the back seat in most of the cognitive science research are the focus of attention in this study which addresses the creation of similarity within an elaborately laid out interactive framework of cognition Starting from the constructivist views of Nelson Goodman and Jean Piaget this framework resolves an apparent paradox in interactionism how can reality not have a mind independent ontology and structure but still manage to constrain the possible worlds a cognitive agent can create in it A comprehensive theory of metaphor is proposed in this framework that explains how metaphors can create similarities and why such metaphors are an invaluable asset to cognition The framework is then applied to related issues of analogical reasoning induction and computational modeling of creative metaphors
