Geometric Linear Algebra (Volume 2) I-hsiung Lin, 2008-05-06 This accessible book for beginners uses intuitive geometric concepts to create abstract algebraic theory with a special emphasis on geometric characterizations. The book applies known results to describe various geometries and their invariants and presents problems concerned with linear algebra such as in real and complex analysis, differential equations, differentiable manifolds, differential geometry, Markov chains, and transformation groups. The clear and inductive approach makes this book unique among existing books on linear algebra both in presentation and in content.

Mathematical Principles of the Internet, Volume 2 Nirdosh Bhatnagar, 2018-11-21 This two volume set on Mathematical Principles of the Internet provides a comprehensive overview of the mathematical principles of Internet engineering. The books do not aim to provide all of the mathematical foundations upon which the Internet is based. Instead, they cover a partial panorama and the key principles. Volume 1 explores Internet engineering while the supporting mathematics is covered in Volume 2. The chapters on mathematics complement those on the engineering episodes, and an effort has been made to make this work succinct yet self-contained. Elements of information theory, algebraic coding theory, cryptography, Internet traffic dynamics, and control of Internet congestion and queueing theory are discussed. In addition, stochastic networks, graph theoretic algorithms, application of game theory to the Internet, Internet economics, data mining, and knowledge discovery, and quantum computation, communication, and cryptography are also discussed. In order to study the structure and function of the Internet, only a basic knowledge of number theory, abstract algebra, matrices, and determinants, graph theory, geometry, analysis, optimization theory, probability theory, and stochastic processes is required. These mathematical disciplines are defined and developed in the books to the extent that is needed to develop and justify their application to Internet engineering.

Classical Complex Analysis I-Hsiung Lin, 2011 Classical Complex Analysis provides an introduction to one of the remarkable branches of exact science with an emphasis on the geometric aspects of analytic functions. This volume begins with a geometric description of what a complex number is, followed by a detailed account of algebraic, analytic, and geometric properties of standard complex valued functions. Geometric properties of analytic functions are then developed and described in detail, and various applications of residues are included. Analytic continuation is also introduced. **Book Jacket**

Non-Associative Normed Algebras: Volume 2, Representation Theory and the Zel'manov Approach Miguel Cabrera García, Ángel Rodríguez Palacios, 2018-04-12 This first systematic account of the basic theory of normed algebras without assuming associativity includes many new and unpublished results and is sure to become a central resource for researchers and graduate students in the field. This second volume revisits JB triples, covers Zel'manov's celebrated work in Jordan theory, proves the unit free variant of the Vidav-Palmer theorem, and develops the representation theory of alternative C^* -algebras and non commutative JB algebras. This completes the work begun in the first volume which introduced these

algebras and discussed the so called non associative Gelfand Naimark and Vidav Palmer theorems This book interweaves pure algebra geometry of normed spaces and infinite dimensional complex analysis Novel proofs are presented in complete detail at a level accessible to graduate students The book contains a wealth of historical comments background material examples and an extensive bibliography
