G. Lewars, 2008-12-05 The aim of this book is to survey a number of chemical compounds that some chemists theoretical and experimental find fascinating Some of these compounds like planar carbon species or oxirene offer no obvious practical applications nitrogen oligomers and polymers in contrast have been touted as possible high energy density materials What unites this otherwise eclectic collection is that these substances are unknown and offer a challenge to theory and to synthesis That such a challenge exists is in some cases almost obvious to most chemists The instability of nitrogen polymers for example might be taken nearly as an axiom to be quantified but not refuted by computations and to be subjected to an almost superfluous but rather challenging validation by synthesis On the other hand oxirene the unsaturated relative of the prosaic oxirane presents no immediately obvious oddity yet this molecule has defied all attempts at synthesis and remains a

theoretical conundrum in that it is not certain if it can even exist It is hoped that this collection of idiosyncratic molecules will appeal to chemists who find the study of chemical oddities interesting and on occasion even rewarding A great romp through imagined molecules a challenge to the talents of synthetic chemists Errol Lewars leads us expertly through a wonderland of the chemical imagination fascinating molecular structures that do not yet exist Prof Roald Hoffmann Nobel Laureate Chem 1981 Cornell University New York USA This book is an educational and enjoyable read devoted to species on the fringes of chemical calculation and conceptual plausibility Prof Joel Liebman University of Maryland Baltimore County USA
