Beamed Energy Propulsion Andrew V. Pakhomov, 2003-05-22 Papers presented at the First International Symposium on Beamed Energy Propulsion as the first conference of this kind demonstrated that beamed energy propulsion is an established worldwide field of research and engineering and an extremely active field of new technology Four countries have already launched their lightcrafts and the day when they will reach space is looming in the near future A major demonstration of microwave propulsion in space will be conducted this year Laser based microthrusters are becoming off the shelf technology Microairplanes and dirigibles are now riding on laser beams Even planetary defense systems left sci fi thrillers to become a matter of feasibility discussion Topics include Fluid Dynamics in Laser Propulsion Ablative Laser Propulsion and Microthrusters Microwave Propulsion Microwave Sails Beamed Energy for Interstellar Missions Hybrid Systems and New Concepts Miscellaneous Applications Beam Propelled Microaircraft Beam Generation Propagation and Reception Beamed Energy Propulsion System Analysis and High Power BEP User Testing Facilities

concepts beam transmission and reception beam generation *Investigation of Beamed Energy Concepts for Propulsion. Systems Studies* M. Huberman, J. M. Sellen, R. Benson, W. Davenport, R. Davidheiser, TRW DEFENSE AND SPACE SYSTEMS GROUP REDONDO BEACH CALIF., 1976 The objective of this program is to assess the feasibility of the beamed energy propulsion concept for Air Force missions The results of the study indicate that beamed energy propulsion is technically feasible No fundamental obstacles have been identified However considerable technical development is needed in many areas before the concept can be operationally implemented In order to minimize the required collector area laser concepts are preferred over microwaves If space based laser transmitter concepts are to be cost effective they will require the availability of megawatt level space nuclear or solar power stations In view of the large total energy required for each mission ground based transmitters will be most cost effective when they are operated closed cycle from central station electric power Laser transmitting ranges greater than several hundred nautical miles will result in excessive collector sizes Therefore ground based transmitters applications will be restricted to orbital functions which can be performed at low orbital altitudes Three promising applications have been identified The laser powered tug can be cost effective compared to an advanced cryogenic tug Apsidal rotation correction and drag make up are two other missions where significant advantages may be realized for the laser powered concept Beamed-Energy Propulsion (Bep) Study National Aeronautics Administration, 2014-11-15 The official scope of this study was 1 to review and analyze the state of art in beamed energy propulsion BEP by identifying potential game changing applications 2 to formulate a roadmap of technology development and 3 to identify key near term technology demonstrations to rapidly advance elements of BEP technology to Technology Readiness Level TRL The two major areas of interest were launching payloads and space propulsion More generally the study was requested and structured to address basic mission feasibility The attraction of BEP is the potential for high specific impulse Isp while removing the power generation mass The rapid advancements in high energy beamed power systems and optics over the past 20 years warranted a fresh look at the technology BEP could help meet the known needs of NASA and or the Department of Defense DOD providing low cost rapid access to space for operationally responsive military systems scientific payloads and the commercialization of space For launching payloads the study concluded that using BEP to propel vehicles into space is technically feasible if a commitment to develop new technologies and large investments can be made over long periods of time Such a commitment would include specific technologies like multi megawatt power lasers and microwave sources as well as building new launch facility infrastructure The costs of the infrastructure are high From a commercial competitive standpoint if an advantage of beamed energy for Earth to orbit ETO is to be found it will rest with smaller frequently launched payloads For space propulsion the study concluded that using beamed energy to propel vehicles from low Earth orbit to geosynchronous Earth orbit LEO GEO and into deep space is definitely feasible and showed distinct advantages and greater potential over current propulsion technologies However this conclusion also assumes that upfront

infrastructure investments and commitments to critical technologies will be made over long periods of time BEP energy source requirements are much less than for the launch applications Lower propulsion costs with shorter transit times for LEO GEO servicing missions and faster science missions to the outer planets are the major benefits The chief issue similar to that for payloads is high infrastructure costs As can happen in detailed examinations of innovative approaches the study uncovered two unanticipated areas that appear to have great potential and therefore are worthy of consideration for new investment at least at the detailed study level BEP could provide the key to combining propulsion power and communications systems for in space applications thus creating a new class of small spacecraft with minimal systems and reducing their complexity cost and mass Beaming energy to a thermal optical plasma engine could provide a highly efficient technology for high thrust and high ISP space propulsion The specifics of these concepts are provided in the main body of the report Finally the intention of this study was to work within the time and resources allotted to determine the feasibility of BEP This involved achieving a single closed design solution for each mission analyzed which is in all probability not the optimum solution As such proponents of the investigated concepts may not agree with the study's findings and final design solutions citing that better performance could be achieved with additional design effort The authors do not disagree with that perspective Nonetheless the study management team was satisfied that the results were sufficient to meet the primary objective which was to prove or disprove the feasibility of the concept and missions It is also noted that at this time all possible future demonstrations of beamed energy and power transfer will be pursued solely by NASA

,2002 **Beamed-energy Propulsion (BEP) :** Robert M. Manning,2015 *Beamed-Energy Propulsion (Bep): Considerations for Beaming High Energy-Density Electromagnetic Waves Through the Atmosphere* National Aeronautics and Space Adm Nasa,2019-01-16 A study to determine the feasibility of employing beamed electromagnetic energy for vehicle propulsion within and outside the Earth's atmosphere was co funded by NASA and the Defense Advanced Research Projects Agency that began in June 2010 and culminated in a Summary Presentation in April 2011 A detailed report entitled Beamed Energy Propulsion BEP Study appeared in February 2012 as NASA TM 2012 217014 Of the very many nuances of this subject that were addressed in this report the effects of transferring the required high energy density electromagnetic fields through the atmosphere were discussed However due to the limitations of the length of the report only a summary of the results of the detailed analyses were able to be included It is the intent of the present work to make available the complete analytical modeling work that was done for the BEP project with regard to electromagnetic wave propagation issues In particular the present technical memorandum contains two documents that were prepared in 2011 The first one entitled Effects of Beaming Energy Through the Atmosphere contains an overview of the analysis of the nonlinear problem inherent with the transfer of large amounts of energy through the atmosphere that gives rise to thermally induced changes in the refractive index application is then made to specific beamed propulsion scenarios A brief portion of this report appeared as Appendix G of the

2012 Technical Memorandum The second report entitled An Analytical Assessment of the Thermal Blooming Effects on the Propagation of Optical and Millimeter Wave Focused Beam Waves For Power Beaming Applications was written in October 2010 not previously published provides a more detailed treatment of the propagation problem and its effect on the overall characteristics of the beam such as its deflection as well as its radius Comparisons are then made for power beaming using the disparate electromagnetic wavel
