Oriented Crystallization on Amorphous Substrates E.I. Givargizov, 2013-11-21 Present day science and technology have become increasingly based on studies and applications of thin films This is especially true of solid state physics semiconductor electronics integrated optics computer science and the like In these fields it is necessary to use films with an ordered structure especially single crystalline films because physical phenomena and effects in such films are most reproducible Also active parts of semiconductor and other devices and circuits are created as a rule in single crystal bodies To date single crystalline films have been mainly epitaxial or heteroepitaxial i.e. they have been grown on a single crystalline substrate and principal trends e.g. in the evolution of integrated circuits ICs have been based on continuing reduction in feature size and increase in the number of components per chip However as the size decreases into the submicrometer range technological and physical limitations in integrated electronics become more and more severe It is generally believed that a feature size of about 0.1 μm will have a crucial character In other words the present two dimensional ICs are anticipated to reach their limit of minimization in the near future and it is realized that further increase of packing density and/or functions might depend on three dimensional integration To solve the problem techniques for preparation of single crystalline films on arbitrary including amorphous substrates are essential **Energy Research Abstracts**, 1988 **Rapid Thermal**

Processing of Semiconductors Victor E. Borisenko, Peter J. Hesketh, 2013-11-22 Rapid thermal processing has contributed to the development of single wafer cluster processing tools and other innovations in integrated circuit manufacturing environments Borisenko and Hesketh review theoretical and experimental progress in the field discussing a wide range of materials processes and conditions They thoroughly cover the work of international investigators in the field **EPM 87.**

Energy Pulse and Particle Beam Modification of Materials Klaus Hennig, 2022-08-01 No detailed description available for EPM 87 Energy Pulse and Particle Beam Modification of Materials [Silicon-Molecular Beam Epitaxy](#) E.

Kasper, 2018-05-04 This subject is divided into two volumes Volume I is on homoepitaxy with the necessary systems techniques and models for growth and dopant incorporation Three chapters on homoepitaxy are followed by two chapters describing the different ways in which MBE may be applied to create insulator Si stackings which may be used for three dimensional circuits The two remaining chapters in Volume I are devoted to device applications The first three chapters of Volume II treat all aspects of heteroepitaxy with the exception of the epitaxial insulator Si structures already treated in volume I **Laser Processing and Chemistry** Dieter Bäuerle, 2013-03-09 Laser Processing and Chemistry gives an

overview of the fundamentals and applications of laser-matter interactions in particular with regard to laser material processing Special attention is given to laser induced physical and chemical processes at gas-solid liquid-solid and solid-solid

interfaces Starting with the background physics the book proceeds to examine applications of laser techniques in micro machining and the patterning coating and modification of material surfaces Students engineers and manufacturers alike will find this book an invaluable reference work for the state of the art in laser processing *Fundamental Aspects of Inert Gases in Solids* S.E. Donnelly, J.H. Evans, 2013-12-20 The NATO Advanced Research Workshop on Fundamental Aspects of Inert Gases in Solids held at Bonas France from 16-22 September 1990 was the fifth in a series of meetings that have been held in this topic area since 1979 The Consultants Meeting in that year at Harwell on Rare Gas Behaviour in Metals and Ionic Solids was followed in 1982 by the Jilich International Symposium on Fundamental Aspects of Helium in Metals Two smaller meetings have followed a CECAM organised workshop on Helium Bubbles in Metals was held at Orsay France in 1986 while in February 1989 a Topical Symposium on Noble Gases in Metals was held in Las Vegas as part of the large TMS AIME Spring Meeting As is well known the dominating feature of inert gas atoms in most solids is their high heat of solution leading in most situations to an essentially zero solubility and gas atom precipitation In organising the workshop one particular aim was to target the researchers in the field of inert gas solid interactions from three different areas namely metals tritides and nuclear fuels in order to encourage and foster the cross fertilisation of approaches and ideas In these three material classes the behaviour of inert gases in metals has probably been most studied partly from technological considerations the effects of helium production via nuclear reactions during neutron irradiation are of importance particularly in a fusion reactor environment and partly from a more fundamental viewpoint **Structure-Property Relationships in Surface-Modified Ceramics** C.J. McHargue, R. Kossowsky, Wolfgang O. Hofer, 2012-12-06 The use of ion beams for the modification of the structure and properties of the near surface region of ceramics began in earnest in the early 1980s Since the mechanical properties of such materials are dominated by surface flaws and the surface stress state the use of surface modification techniques would appear to be an obvious application As is often the case in research and development most of the initial studies can be characterized as cataloging the response of various ceramic materials to a range of ion beam treatments The systematic study of material and ion beam parameters is well underway and we are now designing experiments to provide specific information about the processing parameter structure property relationships This NATO Advanced Study Institute was convened in order to assess our current state of knowledge in this field to identify opportunities and needs for further research and to identify the potential of such processes for technological application It became apparent that this class of inorganic compounds loosely termed ceramics presents many challenges to the understanding of ion solid interactions the relationships among ion beam parameters materials parameters and the resulting structures as well as relationships between structure and properties In many instances this understanding will represent a major extension of that learned from the study of metals and semiconductors
