Raimund R. Pohl, 2003 Canadian Journal of Genetics and Cytology, 1968 Reproductive and Developmental Strategies
Kazuya Kobayashi, Takeshi Kitano, Yasuhiro Iwao, Mariko Kondo, 2018-06-01 This book provides new insights into the universality of biological systems in animal reproduction and development by a comparative study of a variety of mechanisms in animals ranging from basal invertebrates to vertebrates including mammals. Animals accomplish genetic diversity through meiosis and fertilization and during embryogenesis animals must produce specialized cell types including germ cells in accordance with their individual body plan. This series of phenomena is essential to the continuity of life in the animal kingdom and animals show various reproductive and developmental strategies. This volume comprising four parts reviews animal kingdom diversity including reproductive strategies and germ cell differentiation mechanisms. Part 1 sex determination and differentiation. Part 2 the mechanisms of fertilization. Part 3 and body axis formation. Part 4 Readers will find descriptions of the reproduction or development of 180 species, 13 phyla, 35 classes, 74 orders, 117 families and 151 genera in this book. Of particular interest is the diversity of molecules and mechanisms used to achieve the same biological purpose in different animals. Undergraduates, graduate students and professional scientists who want a deeper understanding of animal reproductive and developmental mechanisms will find this book to be of great value.

Biochemical Sites of Insecticide Action and Resistance Isaac Ishaaya, 2012-12-06 In recent years many of the conventional methods of insect control by broad spectrum synthetic chemicals have come under scrutiny because of their undesirable effects on human health and the environment. In addition some classes of pesticide chemistry which generated resistance problems and severely affected the environment are no longer used. It is against this background that the authors of this book present up to date findings relating to biochemical sites that can serve as targets for developing insecticides with selective properties and as the basis for the elucidation of resistance mechanisms and countermeasures. The book consists of eight chapters relating to biochemical targets for insecticide action and seven chapters relating to biochemical modes of resistance and countermeasures. The authors of the chapters are world leaders in pesticide chemistry, biochemical modes of action and mechanisms of resistance. Biochemical sites such as chitin formation, juvenile hormone and ecdysone receptors, acetylcholine and GABA receptors, ion channels and neuropeptides are potential targets for insecticide action. The progress made in recent years in molecular biology presented in depth in this volume has led to the identification of genes that confer mechanisms of resistance such as increased detoxification, decreased penetration and insensitive target sites. A combination of factors can lead to potentiation of the resistance level. Classifications of these mechanisms are termed gene amplification, changes in structural genes and modification of gene expression.

Comparative Animal Biochemistry Klaus Urich, 2013-04-17 tribute greatly to understanding the origins of. The plan for this book goes back almost 20 years. Already at that time it was possible

to recognize organisms an extraordinary variation in metabolites and To provide the biochemist with a ready over processes superimposed upon the basic biochem view of the structural diversity of animals the book includes a simplified version of animal sys ical system of animals Each species each indi tematics for further information on the classifica vidual in fact each type of cell of the multicellu lar organism possesses its own biochemical char tion structure and life of particular animal spe acter and this molecular variety its biological sig cies the reader should consult the relevant text nificance and its evolutionary development books It is assumed that the zoologist reader has throw up many interesting questions The com a basic knowledge of biochemistry important general biochemical facts are in any case given for parative approach that has been so productive at many of the subjects covered the higher levels of complexity of morphology and physiology can also be used to great effect at I had already completed several chapters of the molecular level this book by the beginning of the 1970s

Development, structure and function of vertebrate retinas: A virtual festschrift for Prof. Steve Massey David W. Marshak, Judith Mosinger Ogilvie, Chai-An Mao, Christophe P. Ribelayga, 2024-09-19 This is a remarkable time to study the vertebrate retina either as a model for the brain or to understand the first steps in vision We have known about the diversity of retinal neurons and glia for more than one hundred years and we are now extending these findings and making new discoveries about retinal cell types by analyzing gene expression in single cells We have made significant progress toward our ultimate goals of describing the neural circuits in the retinas at the level of connections between identified populations of neurons and understanding neuronal and glial cell function at the molecular level We have also made great strides toward understanding retinal development and the etiology of retinal diseases Physiologists are now using more realistic stimuli and modern analytical methods to analyze the mechanisms underlying light responses of retinal neurons and this has led to more accurate computational models of neural circuits in the retina My colleague at the McGovern Medical School in Houston Steve Massey has made many important contributions to this field both as a researcher and as a mentor and he is planning his retirement Judith Ogilvie Christophe Ribelayga Chai an Mao and I will dedicate this issue to him and plan to publish some of his latest work This Research Topic will include mini reviews and brief communications about neurons and neural circuits in vertebrate retinas The scope will be very broad including anatomical physiological psychophysical and computational approaches to this topic Potential topics include but are not restricted to Development morphology and synaptic connections of neuronal types Light responses spontaneous activity and membrane properties of retinal neurons Gene expression and other aspects of cell biology of identified retinal neurons Release of neurotransmitters and modulators and their effects in the retina Structure and function of electrical synapses in the retina Neural circuits that mediate responses to color contrast and movement Roles of neuroglia in retinal development homeostasis and light responses Contributions of neural circuits in the retina to visual perception Evolution of neuronal types and neural circuits in the retina Novel techniques for analyzing retinal neurons and neural circuits Non invasive methods to analyze retinal structure and function Etiology of retinal diseases and
