Strategic Perspectives in Solid Waste and Wastewater Management explores conventional and advanced biotechnologies for waste management including socio economic aspects, techno economic feasibility models and modeling tools and a detailed life cycle assessment approach in solid waste (SW) and wastewater (WW). These innovative technologies are highly applicable to current real world situations. The enormous increase in the quantum and diversity of SW and WW including waste materials generated due to human activity and their potentially harmful effects on the environment and public health have led to increasing awareness about an urgent need to adopt novel technologies for appropriate management of both SW and WW. While there is an obvious need to minimize the generation of wastes and to reuse and recycle them, the technologies for managing such wastes can play a vital role in mitigating problems. Besides recovery of substantial energy, these technologies can lead to a considerable reduction in the overall waste quantities requiring final disposal which can be better managed for safe disposal in a controlled manner while meeting pollution control standards. Outlines appropriate technologies for solid waste and wastewater management systems and their applications. Presents and evaluates the Best Available Technology (BAT) and includes global case studies. Provides methods for evaluating the way to use appropriate technological systems to develop the best technically and economically feasible projects worldwide. Offers an excellent resource for university students to use for their research and dissertations.
