Biophysical Ecology:

Perspectives of Biophysical Ecology D M Gates, R B Schmerl, 1975-05-02 **Biophysical Ecology** D. M.

Gates, 2012-12-06 The objective of this book is to make analytical methods available to students of ecology. The text deals with concepts of energy exchange, gas exchange and chemical kinetics involving the interactions of plants and animals with their environments. The first four chapters are designed to show the applications of biophysical ecology in a preliminary simplified manner. Chapters 5-10 treating the topics of radiation, convection, conduction and evaporation are concerned with the physical environment. The spectral properties of radiation and matter are thoroughly described as well as the geometrical instantaneous daily and annual amounts of both shortwave and longwave radiation. Later chapters give the more elaborate analytical methods necessary for the study of photosynthesis in plants and energy budgets in animals. The final chapter describes the temperature responses of plants and animals. The discipline of biophysical ecology is rapidly growing and some important topics and references are not included due to limitations of space, cost and time. The methodology of some aspects of ecology is illustrated by the subject matter of this book. It is hoped that future students of the subject will carry it far beyond its present status. Ideas for advancing the subject matter of biophysical ecology exceed individual capacities for effort and even today many investigators in ecology are studying subjects for which they are inadequately prepared. The potential of modern science in the minds and hands of skilled investigators to of the interactions of organisms with their advance our understanding environment is enormous.

Biophysical Ecology David Murray Gates, 1980 **An Introduction to Environmental Biophysics** Gaylon S. Campbell, 2012-12-06 The study of environmental biophysics probably began earlier in man's history than that of any other science. The study of organism-environment interaction provided a key to survival and progress. Systematic study of the science and recording of experimental results goes back many hundreds of years. Benjamin Franklin, the early American statesman, inventor, printer and scientist, studied conduction, evaporation and radiation. One of his observations is as follows: My desk on which I now write and the lock of my desk are both exposed to the same temperature of the air and have therefore the same degree of heat or cold yet if I lay my hand successively on the wood and on the metal the latter feels much the coldest not that it is really so but being a better conductor it more readily than the wood takes away and draws into itself the fire that was in my skin. Franklin probably was not the first to discover this principle and certainly was not the last. Modern researchers rediscover this principle frequently in their own work. It is sometimes surprising how slowly progress is made. Progress in environmental biophysics since the observations of Franklin and others has been mainly in two areas: use of mathematical models to quantify rates of heat and mass transfer and use of the continuity equation that has led to energy budget analyses.

Global Climatology and Ecodynamics Arthur Philip Cracknell, Vladimir F. Krapivin, 2008-11-04 The exclusive role of natural ecosystems is a key factor in the maintenance of the biospheric equilibrium. The current global crisis is largely caused by their dramatic decline by 43% in the past hundred years. Ignoring the

immutable laws and limitations which determine the existence of all living things in the biosphere could lead humanity to an ecological catastrophe This book presents the ecological demographic economic and socio psychological manifestations of the global crisis and outlines the immutable laws and limitations which determine the existence of all living things in the biosphere The authors are eminently qualified to write about the problems associated with the global crisis and consider the causes behind humanity s conflict with its environment V Danilov Danilian Associate of the Russian Academy of Sciences and Russia s former Minister of the Environment and K Losev professor at Moscow State university are leading Russian ecologists and I Reyf is a journalist who specializes in ecology and global development Dr Danilov Danilian works on the economics of nature management economic and mathematical model building sustainable development theory and ecology Dr Losev is the chief researcher and head of the division of the VINITI All the authors have published numerous papers articles and books on such subjects as glaciology hydrology environment studies global change and sustainable development
