

B. Homodimers as receptors ligands

- Identical twin drugs have shown increasing potencies and/ or modified selectivity profiles as receptor ligands, when compared to their corresponding single drug.
- Several receptors of biogenic amines (catecholamine's), quaternary ammoniums (acetylcholine, PAF-acether), and peptides (angiotensin, endothelin) belong to the well-known class of G-protein- coupled receptors (GPCR).
- They present one subunit with seven Trans's membrane spanning domains, three extracellular and three intracellular loops, which are coupled to G-proteins.
- Duplication of drugs within this series of ligands has been efficient in several cases.
- Piperidine-based dimer ligands were prepared and evaluated for their inhibiting activity for dopamine (DA) and serotonin (5-HT) transporters.

C. Homodimers as enzyme inhibitors

- The symmetrical arrangement of enzymes into homodimers or tetramers defines the active site of the enzyme in a highly symmetrical fashion.
- Thus, symmetrical inhibitors will correspond generally to the binding site of the enzyme.
