

Effects of Climate Change

The global temperature is forecast to be around 1.20°C in 2033 - one of the Earth's hottest years ever recorded.

Globally aviation accounts for 2.5% of CO2 emissions, but they also contribute twice as much to global warming with nitrogen oxides (NOx), vapour trails, and cloud formation triggered by the altitude at which they fly.

Climate change directly increases severe weather events, such as forest fires, hurricanes and droughts.

Manufacturing, particularly of construction materials, accounts for a third of global greenhouse gas emissions.

Increasing temperatures are causing a loss of ice and melting permafrost, which affects wildlife such as polar bears, walrus, reindeer and many other species. It also leads to increased sea levels and the risk of floods.

Deforestation and the destruction of forests through weather events, reduce their ability to store carbon and provide other ecosystems.

Sea levels globally are rising by 3.7mm per year. By 2050, sea levels are predicted to rise by around 30cm. This will cause more coastal flooding and erosion.

Increased ocean temperatures have caused over half of coral reef cover across the world to be lost. This means the loss of biodiversity, habitats for fish and other species, and the natural barrier to sea storms for coastal communities.
