

HOW ARE BIOLOGICAL WEAPONS DEVELOPED & TESTED?

1 CHOOSE AN AGENT

Factors considered in choosing an agent include: Pathogenicity (amount required to cause disease); Virulence (disease severity); Incubation (amount of time to cause harm after exposure); Lethality (how deadly the agent is); Transmissibility (how the disease spreads); and Countermeasures (treatments or cures).

2 ACQUIRE THE AGENT

Agents could be purchased from a microbiological laboratory or bank, or isolated from natural sources such as animals, soil, or water. Agents could also be acquired through scientists or technicians working in other BW programs, or created from scratch by altering an existing pathogen's genetic code.

3 ACQUIRE A PRODUCTION METHOD

The production method produces small quantities that could later be scaled up for mass production. The choice of method would depend on the agent, how it would be used and the quantity necessary. Most agents would require nutrients to grow, many of which are widely available due to use in commercial industries.

4 STABILIZE THE AGENT

Biological agents break down over time and eventually die. Stabilization slows an agent's metabolism so they can be stockpiled. Some agents can naturally slow their metabolism by forming spores, and scientists can emulate this process in others through microencapsulation, applying a layer of protective coating.

5 CONCENTRATE THE AGENT

Concentrating the agent makes it lethal in small doses. This can be done through vacuum filtration, ultrafiltration, precipitation, and centrifugation.

6 CHOOSE A DELIVERY METHOD

Aerosols, tiny particles that can be suspended in the air and inhaled, are the best method for infecting a person with a biological agent. Some diseases are usually carried by vectors like ticks. But these diseases are often more virulent and easier to disseminate when they are aerosolized.

7 FIELD TESTING

Field testing can be done in a laboratory, through open-air tests in controlled environments, or on animals. There are also rare cases of countries using humans to test agents, such as Japan using prisoners as test agents during WWII, and the U.S. testing tularemia and Q fever on human volunteers from 1954-1973.

8 MASS PRODUCTION

Depending on the agent, large quantities may be needed to carry out a successful attack. Devices such as bioreactors or fermenters can grow cells on a large scale. Environmental conditions inside these devices, such as temperature, pH, and the presence of gases, must be carefully controlled to keep the cells alive.

9 STOCKPILE AND MOBILIZE WEAPONS

Once stabilized and loaded into a delivery system, the weapons can be stockpiled. Even stabilized biological agents will decay over time, so stockpiles do not last indefinitely.
