

two sets of "univariate" transformed observations which then may be studied by graphical methods. Many programs available at computation centers do this as a part of the regular calculations, and some programs even make the histograms.

MODEL VIII: CORRELATIONS BETWEEN SETS OF VARIABLES

This model analyzes the significance of the degree of correlation between two sets of variables—for example, the correlation between a set of morphologic variables and a set of ecological variables. The statistical method employed is known as *canonical correlation*, another of the multivariate techniques originally introduced by Hotelling. Figure 8 provides a schematic representation of the concept. Symbols V and W could represent two ecological factors with which the correlation of a set of measurements, X, Y, and Z, on some organism is to be estimated. In a way, the concepts behind canonical correlation and related statistical theory may be regarded as a generalization of the regression model. It will be seen that the method is particularly suitable for ecologic studies, although it was originally devised for a psychometric problem. The present writer has used canonical correlation in studying the interrelationships between organic constituents and electrochemical variates in a deltaic environment.

MODEL IX: A PREDICTION MODEL

In paleontologic systematics, one may sometimes have a good set of measurements on material of a fossil organism and it may be desired to make use of such information for predicting some missing measurement on a damaged specimen. The technique employed in this connection is multiple regression. Numerous applications of multiple regression analysis are being made by geologists and petroleum

FIGURE 8 Example representing the canonical correlation method. Correlation of ecological factors (V and W) with measurements of organisms (X, Y, and Z) is to be estimated.
