Beginner's Course in Topology V. A. Rokhlin, 1984 **Beginner's Course in Topology** D. B. Fuks, V. A.

Rokhlin, 2004-03-16 This book is the result of reworking part of a rather lengthy course of lectures of which we delivered several versions at the Leningrad and Moscow Universities In these lectures we presented an introduction to the fundamental topics of topology homology theory homotopy theory theory of bundles and topology of manifolds The structure of the course was well determined by the guiding term elementary topology whose main significance resides in the fact that it made us use a rather simple apparatus In this book we have retained those sections of the course where algebra plays a subordinate role We plan to publish the more algebraic part of the lectures as a separate book Reprocessing the lectures to produce the book resulted in the profits and losses inherent in such a situation the rigour has increased to the detriment of the intuitiveness the geometric descriptions have been replaced by formulas needing interpretations etc Nevertheless it seems to us that the book retains the main qualities of our lectures their elementary systematic and pedagogical features The preparation of the reader is assumed to be limited to the usual knowledge of set theory algebra and calculus which mathematics students should master after the first year and a half of studies The exposition is accompanied by examples and exercises We hope that the book can be used as a topology textbook *Books in Series*, 1985 Vols for 1980 issued in three parts Series Authors and Titles **Beginner's Course in Topology** D. modern algebra as shown in this volume This volume also studies topological properties such as compactness and connectedness Considering the importance of compactness in mathematics this study covers the Stone Cech compactification and Alexandroff one point compactification This volume also includes the Urysohn lemma Urysohn metrization theorem Tietz extension theorem and Gelfand Kolmogoroff theorem The content of this volume is spread into eight chapters of which the last chapter conveys the history of metric spaces and the history of the emergence of the concepts leading to the development of topology as a subject with their motivations with an emphasis on general topology It includes more material than is comfortably covered by beginner students in a one semester course Students of advanced courses will also find the book useful This book will promote the scope power and active learning of the subject all the while covering a wide range of theories and applications in a balanced unified way

Essential Topology Martin D. Crossley, 2006-02-02 This book brings the most important aspects of modern topology within reach of a second year undergraduate student It successfully unites the most exciting aspects of modern topology with those that are most useful for research leaving readers prepared and motivated for further study Written from a thoroughly modern perspective every topic is introduced with an explanation of why it is being studied and a huge number of examples provide further motivation The book is ideal for self study and assumes only a familiarity with the notion of continuity and basic algebra

Topology and Geometry Glen E. Bredon, 1993-06-24 This book offers an introductory course in algebraic topology Starting with general topology it discusses differentiable manifolds cohomology products and duality the fundamental group homology theory and homotopy theory From the reviews An interesting and original graduate text in topology and geometry a good lecturer can use this text to create a fine course A beginning graduate student can use this text to learn a great deal of mathematics MATHEMATICAL REVIEWS

A Basic Course in Topology Gerd Laures, Markus Szymik, 2025-02-17 This book serves as an introduction to topology a branch of mathematics that studies the qualitative properties of geometric objects It is designed as a bridge between elementary courses in analysis and linear algebra and more advanced classes in algebraic and geometric topology making it particularly suitable for both undergraduate and graduate mathematics students Additionally it can be used for self study The authors employ the modern language of category theory to unify and clarify the concepts presented with definitions supported by numerous examples and illustrations The book includes over 170 exercises that reinforce and deepen the understanding of the material Many sections feature brief insights into advanced topics providing a foundation for study projects or seminar presentations In addition to set theoretic topology the book covers essential concepts such as fundamental groups covering spaces bundles sheaves and simplicial methods which are vital in contemporary geometry and topology

Basic Topology 3 Mahima Ranjan Adhikari, 2023-03-15 This third of the three volume book is targeted as a basic course in algebraic topology and topology for fiber bundles for undergraduate and graduate students of mathematics It focuses on many variants of topology and its applications in modern analysis geometry and algebra Topics covered in this

volume include homotopy theory homology and cohomology theories homotopy theory of fiber bundles Euler characteristic and the Betti number It also includes certain classic problems such as the Jordan curve theorem along with the discussions on higher homotopy groups and establishes links between homotopy and homology theories axiomatic approach to homology and cohomology as inaugurated by Eilenberg and Steenrod It includes more material than is comfortably covered by beginner students in a one semester course Students of advanced courses will also find the book useful This book will promote the scope power and active learning of the subject all the while covering a wide range of theory and applications in a balanced unified way

Algebraic Topology William Fulton, 2013-12-01 To the Teacher This book is designed to introduce a student to some of the important ideas of algebraic topology by emphasizing the relations of these ideas with other areas of mathematics Rather than choosing one point of view of modern topology homotopy theory simplicial complexes singular theory axiomatic homology differential topology etc we concentrate our attention on concrete problems in low dimensions introducing only as much algebraic machinery as necessary for the problems we meet This makes it possible to see a wider variety of important features of the subject than is usual in a beginning text The book is designed for students of mathematics or science who are not aiming to become practicing algebraic topologists without we hope discouraging budding topologists We also feel that this approach is in better harmony with the historical development of the subject What would we like a student to know after a first course in topology assuming we reject the answer half of what one would like the student to know after a second course in topology Our answers to this have guided the choice of material which includes understanding the relation between homology and integration first on plane domains later on Riemann surfaces and in higher dimensions winding numbers and degrees of mappings fixed point theorems applications such as the Jordan curve theorem invariance of domain in spaces of vector fields and Euler characteristics fundamental groups
