Anatomical Dissections for Use in Neurosurgery Wolfgang Seeger, 2012-12-06 This book is published in two volumes Velum medullare posterior in the area of the 4th In this first volume an attempt is made to give young ventricle including the choroid point of the PICA neurosurgeons methodical instruction in the dissection can be studied exactly These examples were chosen from formaldehyde preserved brains This book because exact topographical knowledge of these vessels however is not intended to be taken as a textbook on itself rich structure is often inadequate and when using modern operative techniques increasingly more on anatomy Conventional presentations of the anatomy of the brain must present step by step the individual operations are performed in just these particular areas systems of the organ according to its developmental These dissections compose the content of the first and functional aspects e.g. cortex limbic system volume basal ganglia brainstem and cerebellum Because The second volume is intended for experienced during a single operation the neurosurgeon is some neurosurgeons who perform complex operations deep times confronted with all the various systems it is inside the brain Some of these operations have to be necessary to perform brain dissections from the view come standardized e.g. the opening of the Sylvian point of operative approaches Therefore in this fissure with operations in the area of the Insula and work the attempt is made to keep certain individual cranial base Other complex operations are per surface structures e.g. the Gyrus praecentralis intact formed seldom even today e.g. approaches to the until the end of the dissection so that the relative 3rd ventricle Velum interpositum lateral ventricle topographical positions of surface and deep structures Cisterna tecti Lobulus quadrangularis cerebelli to can be made discernable For these reasons it is name just a few Before such operations it is advisable to view the surface structures of the brain in able the author still does so occasionally to orientate relationship to the skull but then to start with oneself on a formaldehyde preserved brain It is moving the blood vessels and leptomeninges so that in shown how on a formaldehyde preserved brain even this way the skeletonized organ is dissected step by step though it does not provide the real conditions of a live step because in the preserved vascular system the brain under the operative microscope the most important structures are only partially recognizable and thus important topographical relationships can be recognized confusing For this dissection two organs are needed In the first dissection the cerebrum and cerebellum Both volumes are the result of a one year dissection are studied These the young neurosurgeon should course for colleagues meeting twice a week in our have become familiar during his initial training in the clinic
