Atlas of Germ Cell Tumours Grete Kraq Jacobsen,A. Talerman,1991-01-16 *Urologic Pathology* Robert O. Petersen,I. Sesterhenn,Charles J. Davis,2009 Featuring over 600 full color illustrations the Third Edition of this definitive reference provides comprehensive current and authoritative coverage of the entire spectrum of urologic surgical pathology The book emphasizes diagnostic morphology and includes clinical pathologic correlations This thoroughly updated edition clarifies histologic variants of prognostic value in urinary bladder cancers and prostate carcinomas and identifies tumor markers useful in both diagnosis and post therapy management of cancer patients Also included are current diagnostic criteria for urothelial carcinomas the latest TNM staging of urogenital organ malignancies and up to date renal tumor classifications including cytogenetic immunohistochemical and morphologic correlations A companion Website will offer the fully searchable text and an image bank **Tumors of the Testis and Adjacent Structures** Thomas M. Ulbright,Robert H. Young,American Registry of Pathology,2013 This edition represents a significant expansion of both the textual and illustrative material of the previous volume The numerous images reflect the authors belief that the atlas role that was the intent of the original edition is of paramount importance in this work At the same time the current scope is no longer primarily that of a visual resource but also a comprehensive guide to clinical pathologic immunohistochemical molecular biologic prognostic and to a limited extent therapeutic aspects of the various entities For this reason the authors have greatly expanded coverage of the immunohistochemical and molecular features of the various lesions recognising that such information is quickly supplemented by new observations Nonetheless they continue to believe that careful gross examination and routine light microscopic observations are the foundations for diagnosis of these neoplasms and neoplastic like processes A complement to Tumors of the Prostate Gland Seminal Vesicles Penis and Scrotum this volume will serve as an outstanding resource for the diagnosis of testicular neoplasms for pathologists at all levels of experience **Pathology and Biology of Human Germ Cell Tumors** Francisco F. Nogales,Rafael E. Jimenez,2017-03-06 This book provides for the first time a detailed up to date holistic approach to the pathology and biology of germ cell tumors The main focus is the complex histopathology of these tumors but special considerations are also given to their morphologic variations in relation to age gender and organ Critical updates are provided on terminology and classification the discussion of biology and pathogenesis includes references to many molecular genetic and immunohistochemical findings from recent stem cell research Individual chapters are devoted to germ cell tumors at different anatomic locations including not only the ovaries and testes but also the mediastinum and central nervous system and pediatric tumors All of the contributing authors are opinion leaders from universities of excellence in Europe and the United States This monograph will be of wide interest to practitioners and researchers in many fields of medicine including pathology gynecology urology and pediatrics as well as stem cell scientists Carcinoma of the Kidney and Testis, and Rare Urologic Malignancies Zbigniew Petrovich,Luc

Baert, Luther W. Brady, 2013-11-11 In the United States in 1997 28800 new cases of malignant tumors of the kidney and renal pelvis were diagnosed along with 2100 new cases of malignant tumors of the ureter and other urinary organs 7200 primary malignant tumors of the testis and 1300 primary malignant tumors of the penis and other genital organs In large measure surgery is the treatment of choice for these tumors but radiation therapy is increasingly recognized as having significant and important curative and palliative benefits in each of these tumor sites Surgery is the standard form of treatment for non metastatic renal cell carcinomas as well as for malignancies of the renal pelvis and ureter with radical nephrectomy and radical uretectomy being employed However postoperative radiation therapy is of value for those patients who demonstrate evidence of residual tumor following surgery transection of tumor during surgery or positive regional lymph node drainage As regards the rare tumors that involve the female urethra surgical resection is appropriate for those that are limited and local in character and amenable to partial ureterectomy With tumors that are more advanced in character however local recurrence and lymphatic dissemination are significant problems and treatment by radiation therapy programs alone yield satisfactory control rates as well as limited recurrences and long term survivors For primary tumors involving the testis the major approach to nonseminomatous tumors is surgical resection with postsurgical systemic chemotherapy **Atlas of**

Cancer Cell Lines Part 2 John Masters, Bernhard Ø Palsson, 2006-04-11 Continuous cell lines derived from human cancers are the most widely used resource in laboratory based cancer research The first 3 volumes of this series on Human Cell Culture are devoted to these cancer cell lines The chapters in these first 3 volumes have a common aim Their purpose is to address 3 questions of fundamental importance to the relevance of human cancer cell lines as model systems of each type of

cancer 1 Do the cell lines available accurately represent the clinical presentation 2 Do the cell lines accurately represent the histopathology of the original tumors 3 Do the cell lines accurately represent the molecular genetics of this type of cancer

The cancer cell lines available are derived in most cases from the more aggressive and advanced cancers There are few cell lines derived from low grade organ confined cancers This gap can be filled with conditionally immortalized human cancer cell lines We do not know why the success rate for establishing cell lines is so low for some types of cancer and so high for others The histopathology of the tumor of origin and the extent to which the derived cell line retains the differentiated features of that tumor are critical The concept that a single cell line derived from a tumor at a particular site is representative of tumors at that site is naive and misleading
