Advanced C Narain Gehani,1985-01-01 **Machine Dreaming and Consciousness** J. F. Pagel,Philip

Kirshtein,2017-04-13 Machine Dreaming and Consciousness is the first book to discuss the questions raised by the advent of machine dreaming Artificial intelligence AI systems meeting criteria of primary and self reflexive consciousness are often utilized to extend the human interface creating waking experiences that resemble the human dream Surprisingly AI systems also easily meet all human based operational criteria for dreaming These dreams are far different from anthropomorphic dreaming including such processes as fuzzy logic liquid illogic and integration instability all processes that may be necessary in both biologic and artificial systems to extend creative capacity Today multi linear AI systems are being built to resemble the structural framework of the human central nervous system The creation of the biologic framework of dreaming emotions associative memories and visual imagery is well within our technical capacity AI dreams potentially portend the further development of consciousness in these systems This focus on AI dreaming raises even larger questions In many ways dreaming defines our humanity What is humanly special about the states of dreaming And what are we losing when we limit our focus to its technical and biologic structure and extend the capacity for dreaming into our artificial creations Machine Dreaming and Consciousness provides thorough discussion of these issues for neuroscientists and other researchers investigating consciousness and cognition Addresses the function and role of dream like processing in AI systems Describes the functions of dreaming in the creative process of both humans and machines Presents an alternative approach to the philosophy of machine consciousness Provides thorough discussion of machine dreaming and consciousness for neuroscientists and other researchers investigating consciousness and cognition *Applications in Coastal Modeling* A.S.

Trenhaile,V.C. Lakhan,1989-06-01 The importance of models to facilitate our understanding and management of the coastal system is evident from this book which shows that the preference for using models to study the coastal system is shared not only by different research institutions government military industry and academia but also by researchers from diverse backgrounds With contributions from several leading experts a variety of models physical analytical numerical and computer simulation are presented on various components of the coastal system The book opens by examining the coast as a system and provides an overview of models systems concepts and the systems approach It next covers the simulation design process stressing that modeling and simulation should form an interface between real world processes and the field of General Systems Theory It is clearly shown that a system can be investigated with more than one type of model For example it is shown that waves can be studied with physical models empirical and numerical models or with computer simulation models Likewise beaches can be investigated with physical numerical or empirically based models The indispensability of models to enhance our understanding of coastal dynamics and associated component systems is emphasised Mathematical modeling of rock coast development and the simulation of deltaic depositional systems are covered A chapter on analytical modeling of

predator prey interactions highlights the fact that the coastal system also has biotic resources Finally problems which have to be overcome for the practical application of numerical and simulation models are discussed The explanatory and detailed formulation of the various models together with more than 100 figures make this book worthwhile reading for senior undergraduates graduate students and all coastal researchers interested in the formulation and application of models of the coastal system
