Adenoviruses Models And Vectors In Virus Host Interactions Immune System Oncogenesis Gene Therapy:

Adenoviruses: Model and Vectors in Virus-Host Interactions Walter Doerfler, Petra Böhm, 2013-03-09 After three volumes on adenoviruses in 1995 the past years have seen rapid progress in the field of adenovirus research Moreover adenoviruses have attracted considerable interest as vectors in gene transfer regimens After the first volume on virion and structure viral replication and host cell interaction this second volume deals with the immune system oncogenesis and gene therapy

Humanized Mice Tatsuji Nomura, Takeshi Watanabe, Sonoko Habu, 2008-03-11 The term humanized mouse in this text refers to a mouse in which human tissues and cells have been transplanted and show the same biological function as they do in the human body That is the physiological properties and functions of transplanted human tissues and cells can be analyzed in the mouse instead of using a living human body It should therefore be possible to study the pathophysiology and treatment of human diseases in mice with good reproducibility Thus the humanized mouse can be used as a potent tool in both basic and clinical research in the future The development of appropriate immunodeficient mice has been indispensable in the creation of the humanized mouse which has been achieved through many years of efforts by several laboratories The first stage on the road to the humanized mouse was the report on nude mice by Isaacson and Cattanach in 1962 Thereafter nude mice were studied in detail by Falanagan and in 1968 Pantelouris found that these mice have no thymus gland which suggested that the mice lack transplantation immunity against xenografts such as human hematopoietic stem cells At the Nude Mouse Workshops organized by Regard Povlsen Nomura and colleagues that were held nine times between 1972 and 1997 the possibility of creating a humanized mouse using nude mice was extensively examined The results however showed that certain human cancers can be engrafted in nude mice but unfortunately engraftment of normal human tissue was almost impossible

RNA Interference Patrick J. Paddison, Peter K. Vogt, 2008-01-01 In the last few years the major effect that RNAi has had in invertebrate systems is beginning to take hold in mammalian systems through both single gene knockdown experiments and genome scale screens In the next decade there will no doubt be both notable successes and failures as we attempt to apply this genetic tool to various biological problems Through the introduction of RNAi mammalian systems have finally gained admittance to the pantheon of model genetic systems

T Cell Activation by CD1 and Lipid Antigens Branch D. Moody, 2007-05-10 There is increasing evidence that the CD1 system has been conserved throughout mammalian evolution and is capable of presenting structurally diverse diacylglycerol sphingolipid polyisoprenol and lipopeptide antigens This volume provides a comprehensive discussion of these basic aspects of CD1 biology and summarizes the most recent research into the role of CD1 in infectious autoimmune allergic and neoplastic disease

The World of Rhabdoviruses Z.F. Fu, 2005-08-15 This volume reviews the unique and common features of rhabdoviruses which have a very wide host range and are associated with human diseases and also infect domestic livestock and agricultural plants causing enormous economic loss

DNA Methylation: Development, Genetic Disease and Cancer Walter Doerfler, Petra Böhm, 2006-09-02 It

has become apparent that the genomes of many organisms are characterized by unique patterns of DNA methylation which can differ from genome segment to genome segment and cell type to cell type. These patterns can be instrumental in determining cell type and function. Thus it is not surprising that studies on the role of DNA methylation now occupy center stage in many fields of biology and medicine such as developmental biology, genetic imprinting, genetic disease, tumor biology, gene therapy, cloning of organisms and others. Once again basic research in molecular biology has provided the essential foundation for investigations of biomedical problems.

DNA Methylation: Basic Mechanisms Walter Doerfler, Petra Böhm, 2006-02-25 will follow.

Dislocation and Degradation of Proteins from the Endoplasmic Reticulum Emmanuel Wiertz, Marjolein Kikkert, 2006-02-04. The present volume of Current Topics in Microbiology and Immunology contains seven chapters that illuminate various aspects of a protein's genesis and terminal fate in the endoplasmic reticulum (ER). This area is of immediate medical relevance and has blossomed to no small extent because of the study of molecules central to the function of the immune system: immunoglobulins, T cell receptors, major histocompatibility complex (MHC) encoded products. Similarly the clever strategies used by bacteria or viruses to gain a foothold in the host and ensure their continued survival have uncovered altogether new cell biological principles. It is therefore fitting that a special volume be devoted to the interplay between pathways of protein degradation in the ER and a wide variety of pathogens. The concept of quality control emerged with the appreciation that in the case of multimeric glycoproteins any unpaired glycoprotein subunit had great difficulties leaving its site of synthesis the ER and was destroyed instead. Free immunoglobulin heavy chains were probably the earliest documented example of this kind and were long known to cause pathology when their accumulation went unchecked. Increased knowledge of the biosynthetic pathways of glycoproteins allowed the identification of the ER as an important site where such quality control decisions were made. The T cell receptor for antigen long considered the paradigm of this mode of degradation led the way in these early explorations.

Quasispecies: Concept and Implications for Virology Esteban Domingo, 2006-02-19. Continuous genetic variation and selection of virus subpopulations in the course of RNA virus replications are intimately related to viral disease mechanisms. The central topics of this volume are the origins of the quasispecies concept and the implications of quasispecies dynamics for viral populations.

Mass Vaccination: Global Aspects - Progress and Obstacles Stanley A. Plotkin, 2006-09-21. Mass immunization is the blitzkrieg of vaccination practice. It serves to rapidly protect populations both because of the high coverage achieved and because of the herd immunity thereby induced. However as in war mass immunization campaigns must be conducted intelligently with careful strategy and strong attention to logistics of supply and deployment. If conducted badly mass immunization may fail or even be counterproductive. In this volume some of the most successful practitioners of mass immunization tell us about its art and science. David Heymann and Bruce Aylward of WHO begin the book with a theoretical and practical overview of mass immunization. Michael Lane who participated in the successful effort to eradicate smallpox relates how this was done using mass vaccination and other

strategies Application of mass immunization by the US military is covered by John Grabenstein and Remington Nevin who have a large experience in these matters Karen Noakes and David Salisbury recount the striking successes of mass immunization in the United Kingdom The global control of the clostridia that produce diphtheria toxin is described by Charles Vitek Hepatitis A is decreasing dramatically under the impact of large scale vaccination as Francis Andr illustrates The French experience with Hepatitis B vaccination has been mixed and Francois Denis and Daniel Levy Bruhl explain the circumstances In uenza vaccination is an annual example of large scale campaigns the complexity of which is recounted by Benjamin Schwartz and Pascale Wortley
