Advances in Diagnostics and Management of Adrenal Tumors Piotr Glinicki, Marta Araujo-Castro, Nadia Sawicka-Gutaj, 2025-02-13 Adrenal tumors are commonly encountered in the practice of radiology adrenal incidentalomas. They may arise from the adrenal gland itself either the cortex or the medulla or they could be secondary lesions and they may be benign or malignant. When an adrenal tumor is identified the key clinical questions are whether it is functioning and whether it is malignant. It is vital to be familiar with imaging characteristics of adrenal tumors for appropriate diagnosis and management. Regarding functionality although 75% of adrenal tumors are non-functioning cortical adenomas there is a subset of these masses with important clinical consequences i.e. primary adrenal cancer or metastases to adrenal glands pheochromocytoma and functional tumors that secrete cortisol aldosterone or androgens. The delayed or false diagnosis may lead to development of severe complications of excess of secreted hormones e.g. resistant hypertension diabetes mellitus osteoporosis in case of hypercortisolemia hypertensive crisis or myocardial infarction in case of pheochromocytoma or metastases in case of primary adrenal cancer of malignant pheochromocytoma

Handbook of Immunohistochemistry and in Situ Hybridization of Human Carcinomas M. A. Hayat, 2004-06-16 The various cell types have traditionally been recognized and classified according to their appearance in the light microscope following the process of fixing processing sectioning and staining tissues that is known as histology. Classical histology has been augmented by immunohistochemistry the use of specific antibodies to stain particular molecular species in situ. Immunohistochemistry has allowed the identification of many more cell types than could be visualized by classical histology.
