

3.3. Large Machine with Satellite

This is the situation illustrated by Fig. 3 taken as a whole. It is one point of view, an expansion of the free-standing system of Section 3.1 to provide large-scale sophisticated numerical computation and the secondary storage. The large machine would have of the order of 10⁶ words of storage with disks or drums in addition, and would operate as a smaller machine when required; hence, the notion of the small machine being a satellite. Alternatively, the system can be regarded as a medium large-scale machine to which a graphics satellite has been added. In fast response, the satellite will usually be situated close to the parent machine, since the large machine may be required to compute and store display file, but remote satellite systems exist.

The software for a more sophisticated system such as this is a mixture of graphics in the satellite and a standard batch-type operating system on the big machine. The small machine is used principally to drive the display by using the display processor to produce a picture and by collecting messages coming from the display user via light pen, pushbutton, or other devices. The big machine will be used to do all the computation that requires much arithmetic or storage, such as the analysis of the physical properties of an engineering design, and often also the preparation of the display file for transmission to the satellite. The user may expect to be

enjoy the power of a larger operating system, such as a choice of higher-level programming languages, and perhaps a filing system to enable him to store programs and data on a permanent basis. It should also be possible to program an application of the graphics equipment more or less entirely in a high-level language, e.g., FORTRAN. The two machines will communicate with one another by setting up requests for action (sometimes called "messages") which are saved in a queue until they can be carried out. The list of requests will certainly be sent from the larger machine to the small one, and if the small machine requires the big machine to help service requests from the console, then similar requests will be sent the other way as well.

14. Multiaccess Graphics

The logical extension of a batch-processing system with interactive graphics is to go to a multiaccess system with interactive graphics. If by a multiaccess system it is understood that the system comprises a really large number of consoles, i.e., certainly more than twenty, and that the system will still have spare processing capacity for background work, then one may say that multiaccess interactive graphics systems do not exist. Multiaccess systems with noninteractive graphics, where an output-on-display replaces a typewriter, certainly exist, and there are also systems with other very few consoles (^{18,19}), or else with strictly limited graphic interaction (^{4,17}).

The reason for this is seen in the nature of interaction in graphics. Approximately an order of magnitude more computation and an order of magnitude faster transmission are needed to process a remote display being used with a high degree of interaction. Even relatively simple processes like rotation and pen-tracking were highly time-consuming when they were first programmed. There is a tendency to replace these functions by hardware, but even so, multiaccess interactive graphics is not economically feasible at the time of writing.
