Algebrige Constructing Numerical Equations:

Algebridge: Constructing numerical equations, 1990 **Equations and Inequalities** Jiri Herman, Radan Kucera, Jaromir Simsa, 2000-03-23 A look at solving problems in three areas of classical elementary mathematics equations and systems of equations of various kinds algebraic inequalities and elementary number theory in particular divisibility and diophantine equations In each topic brief theoretical discussions are followed by carefully worked out examples of increasing difficulty and by exercises which range from routine to rather more challenging problems While it emphasizes some methods that are not usually covered in beginning university courses the book nevertheless teaches techniques and skills which are useful beyond the specific topics covered here With approximately 330 examples and 760 exercises **The Analysis and Solution of Cubic and Biquadratic Equations** John Radford Young, 1842 **Algebraic Equations** George Ballard Mathews, 1907

Algebraic Equations George Ballard Mathews, 2015-06-15 Excerpt from Algebraic Equations This tract is intended to give an account of the theory of equations according to the ideas of Galois The conspicuous merit of this method is that it analyses so far as exact algebraical processes permit the set of roots possessed by any given numerical equation To appreciate it properly it is necessary to bear constantly in mind the difference between equalities in value and identities or equivalences in form I hope that this has been made sufficiently clear in the text The method of Abel has not been discussed because it is neither so clear nor so precise as that of Galois and the space thus gained has been filled up with examples and illustrations More than to any other treatise I feel indebted to Professor H Weber's invaluable Algebra where students who are interested in the arithmetical branch of the subject will find a discussion of various types of equations which for lack of space I have been compelled to omit I am obliged to Mr Morris Owen a student of the University College of North Wales for helping me by verifying some long calculations which had to be made in connexion with Art 52 About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at www.forgottenbooks.com This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works **Algebraic Equations** Edgar Dehn, 2004-01-01 This text focuses on the basics of algebraic theory giving detailed explanations of integral functions permutations and groups and Lagrange and Galois theory Many numerical examples with complete solutions 1930 edition **First Course in the Theory of Equations** Leonard Eugene Dickson, 2015-06-12 Excerpt from First Course in the Theory of Equations The theory of equations is not only a necessity in the subsequent mathematical courses and their applications but furnishes an illuminating sequel to geometry algebra and analytic geometry Moreover it develops anew and in greater detail various fundamental ideas of calculus for the simple but important case of polynomials The theory of

equations therefore affords a useful supplement to differential calculus whether taken subsequently or simultaneously It was to meet the numerous needs of the student in regard to his earlier and future mathematical courses that the present book was planned with great care and after wide consultation It differs essentially from the author's Elementary Theory of Equations both in regard to omissions and additions and since it is addressed to younger students and may be used parallel with a course in differential calculus Simpler and more detailed proofs are now employed The exercises are simpler more numerous of greater variety and involve more practical applications This book throws important light on various elementary topics For example an alert student of geometry who has learned how to bisect any angle is apt to ask if every angle can be trisected with ruler and compasses and if not why not After learning how to construct regular polygons of 3 4 5 6 8 and 10 sides he will be inquisitive about the missing ones of 7 and 9 sides The teacher will be in a comfortable position if he knows the facts and what is involved in the simplest discussion to date of these questions as given in Chapter III Other chapters throw needed light on various topics of algebra In particular the theory of graphs is presented in Chapter V in a more scientific and practical manner than was possible in algebra and analytic geometry There is developed a method of computing a real root of an equation with minimum labor and with certainty as to the accuracy of all the decimals obtained About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at www.forgottenbooks.com This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works
