Building And Using Parsed Corpora:

Treebanks A. Abeillé, 2012-12-06 Linguists and engineers in Natural Language Processing tend to use electronic corpora more and more. Most research has long been limited to raw unannotated texts or to tagged texts annotated with parts of speech only but these approaches suffer from a word by word perspective. A new line of research involves corpora with richer annotations such as clauses and major constituents, grammatical functions and dependency links. The first parsed corpora were the English Lancaster treebank and Penn Treebank. New ones have recently been developed for other languages. This book provides a state of the art on work being done with parsed corpora, gathers 21 papers on building and using parsed corpora, raising many relevant questions, deals with a variety of languages and a variety of corpora, is for those working in linguistics, computational linguistics, natural language syntax and grammar. [Handbook of Natural Language Processing](#) Nitin Indurkha, Fred J. Damerau, 2010-02-22 The Handbook of Natural Language Processing Second Edition presents practical tools and techniques for implementing natural language processing in computer systems. Along with removing outdated material, this edition updates every chapter and expands the content to include emerging areas such as sentiment analysis. New to the Second Edition: Greater [Worldwide Language Service Infrastructure](#) Yohei Murakami, Donghui Lin, 2016-03-22 This book constitutes the refereed post-workshop proceedings of the Second International Workshop on Worldwide Language Service Infrastructure WLSI 2015 held in Kyoto, Japan, in January 2015. The 4 full papers included in this volume and presented together with 2 short papers and 8 invited papers were carefully reviewed and selected from 7 submissions. The papers are categorized into four parts: introducing metadata and annotations; providing technologies for language service platforms; atomic language services across different interfaces; policies and development of language resources and services; and collecting reports on language service application. **Trends in Parsing Technology** Harry Bunt, Paola Merlo, Joakim Nivre, 2010-10-06 Computer parsing technology, which breaks down complex linguistic structures into their constituent parts, is a key research area in the automatic processing of human language. This volume is a collection of contributions from leading researchers in the field of natural language processing technology, each of whom detail their recent work, which includes new techniques as well as results. The book presents an overview of the state of the art in current research into parsing technologies, focusing on three important themes: dependency parsing, domain adaptation, and deep parsing. The technology, which has a variety of practical uses, is especially concerned with the methods, tools, and software that can be used to parse automatically. Applications include extracting information from free text or speech, question answering, speech recognition, and comprehension, recommender systems, machine translation, and automatic summarization. New developments in the area of parsing technology are thus widely applicable, and researchers and professionals from a number of fields will find the material here required reading. As well as the other four volumes on parsing technology in this series, this book has a breadth of coverage that makes it suitable both as an overview of the field for graduate students and as a

reference for established researchers in computational linguistics artificial intelligence computer science language engineering information science and cognitive science It will also be of interest to designers developers and advanced users of natural language processing systems including applications such as spoken dialogue text mining multimodal human computer interaction and semantic web technology

The Integration of Phonetic Knowledge in Speech Technology William J. Barry, Wim A. van Dommelen, 2006-03-30 Continued progress in Speech Technology in the face of ever increasing demands on the performance levels of applications is a challenge to the whole speech and language science community Robust recognition and understanding of spontaneous speech in varied environments good comprehensibility and naturalness of expressive speech synthesis are goals that cannot be achieved without a change of paradigm This book argues for interdisciplinary communication and cooperation in problem solving in general and discusses the interaction between speech and language engineering and phonetics in particular With a number of reports on innovative speech technology research as well as more theoretical discussions it addresses the practical scientific and sometimes the philosophical problems that stand in the way of cross disciplinary collaboration and illuminates some of the many possible ways forward Audience Researchers and professionals in speech technology and computational linguists

Spoken Multimodal Human-Computer Dialogue in Mobile Environments Wolfgang Minker, Dirk Bühler, Laila Dybkjær, 2005-08-17 This book is based on publications from the ISCA Tutorial and Research Workshop on Multi Modal Dialogue in Mobile Environments held at Kloster Irsee Germany in 2002 The workshop covered various aspects of devel ment and evaluation of spoken multimodal dialogue systems and components with particular

emphasis on mobile environments and discussed the state the art within this area On the development side the major aspects addressed include speech recognition dialogue management multimodal output generation system architectures full applications and user interface issues On the evaluation side primarily usability evaluation was addressed A number of high quality papers from the workshop were selected to form the basis of this book The volume is divided into three major parts which group together the overall aspects covered by the workshop The selected papers have all been carefully reviewed and improved after the workshop to form the backbone of the book In addition we have supplemented each of the three parts by an invited contribution intended to serve as an overview chapter

Evaluation of Text and Speech Systems Laila Dybkjær, Holmer Hemsén, Wolfgang Minker, 2007-05-07 In its nine chapters this book provides an overview of the state of the art and best practice in several sub fields of evaluation of text and speech systems and components The evaluation aspects covered include speech and speaker recognition speech synthesis animated talking agents part of speech tagging parsing and natural language software like machine translation information retrieval question answering spoken dialogue systems data resources and annotation schemes With its broad coverage and original contributions this book is unique in the field of evaluation of speech and language technology This book is of particular relevance to advanced undergraduate students PhD students academic and industrial researchers and practitioners

Word Sense Disambiguation Eneko Agirre, Philip Edmonds, 2007-11-16 Graeme Hirst University of Toronto Of the many kinds of ambiguity in language the two that have received the most attention in computational linguistics are those of word senses and those of syntactic structure and the reasons for this are clear these ambiguities are overt their resolution is seemingly essential for any practical application and they seem to require a wide variety of methods and knowledge sources with no pattern apparent in what any particular instance requires Right at the birth of artificial intelligence in his 1950 paper Computing machinery and intelligence Alan Turing saw the ability to understand language as an essential test of intelligence and an essential test of language understanding was an ability to disambiguate his example involved deciding between the generic and specific readings of the phrase a winter's day The first generations of AI researchers found it easy to construct examples of ambiguities whose resolution seemed to require vast knowledge and deep understanding of the world and complex inference on this knowledge for example Pharmacists dispense with accuracy The disambiguation problem was in a way nothing less than the artificial intelligence problem itself No use was seen for a disambiguation method that was less than 100% perfect either it worked or it didn't Lexical resources such as they were were considered secondary to non linguistic common sense knowledge of the world

New Developments in Parsing Technology H. Bunt, John Carroll, Giorgio Satta, 2006-01-27 Parsing can be defined as the decomposition of complex structures into their constituent parts and parsing technology as the methods the tools and the software to parse automatically Parsing is a central area of research in the automatic processing of human language Parsers are being used in many application areas for example question answering extraction of information from

text speech recognition and understanding and machine translation New developments in parsing technology are thus widely applicable This book contains contributions from many of today s leading researchers in the area of natural language parsing technology The contributors describe their most recent work and a diverse range of techniques and results This collection provides an excellent picture of the current state of affairs in this area This volume is the third in a series of such collections and its breadth of coverage should make it suitable both as an overview of the current state of the field for graduate students and as a reference for established researchers
