Introduction

Thirty years ago, on July 17, 1981, two walkways in the Hyatt Regency Hotel in Kansas City, Missouri, collapsed, killing 114 people and injuring 216, many of whom were permanently disabled. Two steel walkways were stacked on top of each other and suspended from the ceiling above. The top walkway fell on the bottom walkway, and the two fell onto the floor of the crowded atrium below. The collapse was the worst structural failure in the history of the United States. This paper will briefly discuss the causes of this collapse, design and construction issues, lessons learned, and ethical and legal issues associated with this collapse.

As-Designed Walkway Configuration

The Hyatt Regency Hotel was a 40-story building with an atrium. Three walkways were suspended from the atrium's ceiling using 32-mm (1.25 in.) diameter tension rods (Fig. 1). The 2nd-floor walkway, directly below the 4th-floor walkway, was suspended from the steel beams of the 4th-floor walkway, whereas the 3rd and 4th-floor walkways hung from the atrium's ceiling. The tension rods that supported the 2nd- and 4th-floor walkways were designed

to be continuous rods from the 2nd floor to the atrium ceiling. The architect wanted the walkways to look as light and airy as possible, suspended by thin rods hanging down from the atrium's steel framing above.

After the collapse, investigators determined that this design was capable of supporting only 60% of the minimum load required by Kansas City building code (Kaminetzky 1991).

Revisions during Construction That Caused the Collapse

The manufacturer of the tension rods requested that the 2nd- and 4th-floor rod be changed from one continuous rod into two separate rods (Figs. 2 and 3). This request was made because of the difficulty in making the threads at the 4th floor. Also, these threads would probably have been damaged as the structure of the 4th-floor walkway was hoisted into position. This design change, by itself, is the one that caused the collapse.

In the original design, the beams of the 4th-floor walkway had to support only the weight of the 4th-floor walkway itself (load P_1 in Fig. 2). The weight of the 2nd-floor walkway (load P_2 in Fig. 2) was completely supported by the rods. In the revised design (Fig. 3), the 4th-floor beams were required to support the 4th-floor load (load P_1) and the 2nd-floor load (load P_2). In the original design (Fig. 2), the net directly below the 4th floor would have resisted only load P_1 , whereas in the revised design, it is resisting $P_1 + P_2$ (Figs. 2 and 3).

Unfortunately, the engineer of record (EOR) approved the revised design without performing any calculations to check the
