## **Analysis And Computation Of Fixed Points:**

*Analysis and Computation of Fixed Points* Stephen M. Robinson, 2014-05-10 *Analysis and Computation of Fixed Points* contains the proceedings of a Symposium on Analysis and Computation of Fixed Points held at the University of Wisconsin Madison on May 7 8 1979 The papers focus on the analysis and computation of fixed points and cover topics ranging from paths generated by fixed point algorithms to strongly stable stationary solutions in nonlinear programs A simple reliable numerical algorithm for following homotopy paths is also presented Comprised of nine chapters this book begins by describing the techniques of numerical linear algebra that possess attractive stability properties and exploit sparsity and their application to the linear systems that arise in algorithms that solve equations by constructing piecewise linear homotopies The reader is then introduced to two triangulations for homotopy fixed point algorithms with an arbitrary grid refinement followed by a discussion on some generic properties of paths generated by fixed point algorithms Subsequent chapters deal with topological perturbations in the numerical study of nonlinear eigenvalue and bifurcation problems general equilibrium analysis of taxation policy and solving urban general equilibrium models by fixed point methods The book concludes with an evaluation of economic equilibrium under deformation of the economy This monograph should be of interest to students and specialists in the field of mathematics

**Analysis and Computation of Fixed Points** Stephen M. Robinson, 1980 *Analysis and Computation of Fixed Points* Stephen M. Robinson, 1980 This volume contains the proceedings from the Symposium on Analysis and Computation of Fixed Points held at The University of Wisconsin Madison on May 7 8 1979 Held under the auspices of the Mathematics Research Center sponsored by the National Science Foundation and the United States Army There are eight papers addressing aspects of homotopy theory algebraic topology and the economic implications of computable general equilibrium models The ninth paper is a doctoral dissertation in hopes that its contents will reach interested researchers *Analysis and Computation of Fixed Points* , 1980 *Computing*

*Equilibria and Fixed Points* Zaifu Yang, 2013-04-17 *Computing Equilibria and Fixed Points* is devoted to the computation of equilibria fixed points and stationary points This volume is written with three goals in mind i To give a comprehensive introduction to fixed point methods and to the definition and construction of Gr bner bases ii To discuss several interesting applications of these methods in the fields of general equilibrium theory game theory mathematical programming algebra and symbolic computation iii To introduce several advanced fixed point and stationary point theorems These methods and topics should be of interest not only to economists and game theorists concerned with the computation and existence of equilibrium outcomes in economic models and cooperative and non cooperative games but also to applied mathematicians computer scientists and engineers dealing with models of highly nonlinear systems of equations or polynomial equations

**The Computation of Fixed Points and Applications** M. J. Todd, 2013-03-09 Fixed point algorithms have diverse applications in economics optimization game theory and the numerical solution of boundary value problems Since Scarf's

pioneering work [56, 57] on obtaining approximate fixed points of continuous mappings a great deal of research has been done in extending the applicability and improving the efficiency of fixed point methods. Much of this work is available only in research papers although Scarf's book [58] gives a remarkably clear exposition of the power of fixed point methods. However the algorithms described by Scarf have been superseded by the more sophisticated restart and homotopy techniques of Merrill [8, 9] and Eaves and Saigal [1, 16]. To understand the more efficient algorithms one must become familiar with the notions of triangulation and simplicial approximation whereas Scarf stresses the concept of primitive set. These notes are intended to introduce to a wider audience the most recent fixed point methods and their applications. Our approach is therefore via triangulations. For this reason Scarf is cited less in this manuscript than his contributions would otherwise warrant. We have also confined our treatment of applications to the computation of economic equilibria and the solution of optimization problems. Hansen and Koopmans [28] apply fixed point methods to the computation of an invariant optimal capital stock in an economic growth model. Applications to game theory are discussed in Scarf [56, 58], Shapley [59] and Garcia, Lemke and Luethi [24]. Allgower [1] and Jeppson [31] use fixed point algorithms to find many solutions to boundary value problems.

Mathematical Programming: The State of the Art A. Bachem, M. Grötschel, B. Korte, 2012-12-06

In the late forties Mathematical Programming became a scientific discipline in its own right. Since then it has experienced a tremendous growth. Beginning with economic and military applications it is now among the most important fields of applied mathematics with extensive use in engineering, natural sciences, economics and biological sciences. The lively activity in this area is demonstrated by the fact that as early as 1949 the first Symposium on Mathematical Programming took place in Chicago. Since then mathematical programmers from all over the world have gathered at the international symposia of the Mathematical Programming Society roughly every three years to present their recent research to exchange ideas with their colleagues and to learn about the latest developments in their own and related fields. In 1982 the XI International Symposium on Mathematical Programming was held at the University of Bonn, W. Germany from August 23 to 27. It was organized by the Institut für Ökonometrie und Operations Research of the University of Bonn in collaboration with the Sonderforschungsbereich 21 of the Deutsche Forschungsgemeinschaft. This volume constitutes part of the outgrowth of this symposium and documents its scientific activities. Part I of the book contains information about the symposium, welcoming addresses, lists of committees and sponsors and a brief review about the Fulkerson Prize and the Dantzig Prize which were awarded during the opening ceremony.

Introduction to Numerical Continuation Methods Eugene L. Allgower, Kurt Georg, 2003-01-01

Numerical continuation methods have provided important contributions toward the numerical solution of nonlinear systems of equations for many years. The methods may be used not only to compute solutions which might otherwise be hard to obtain but also to gain insight into qualitative properties of the solutions. Introduction to Numerical Continuation Methods originally published in 1979 was the first book to provide easy access to the numerical aspects of predictor-corrector continuation and piecewise

linear continuation methods Not only do these seemingly distinct methods share many common features and general principles they can be numerically implemented in similar ways Introduction to Numerical Continuation Methods also features the piecewise linear approximation of implicitly defined surfaces the algorithms of which are frequently used in computer graphics mesh generation and the evaluation of surface integrals
