An Analysis Of Time Shared Computer Systems

Akira Sekino

An Analysis Of Time Shared Computer Systems:

An Analysis of Time-shared Computer Systems Allan L. Scherr, 1965 Some of the aspects of the operation of time shared interactive computer systems are analyzed The emphasis is on the reaction of hardware systems to the demands that its users make upon it Simply stated the problem is to characterize both time shared systems and their users in order to be able to predict the performance of the two operating together Portions of this problem include the specification and measurement of user characteristics the development and verification of both simulation and mathematical models for time shared systems and the specification and measurement of performance metrics for such systems The user and some of the performance measurements were made on Project MAC's Compatible Time Sharing System CTSS Author **An Analysis of time-shared computer systems** Allan Lee Scherr, 1967 **An Analysis of Time-shared Computer Systems** Allan Lee Scherr, 1967 Analysis of time shared computer systems based on the use of simulation and mathematical models **An Analytic Study of a Shared Device Among Independent Computing Systems** Alan Mink, 1980 **Analysis of a Continuum of Processor-sharing Models for Time-shared Computer Systems** Jiunn Hsu, 1971 Processor sharing models of time shared computer systems are defined and some new results are presented The major emphasis of this research is on the modeling and analysis of new models of time shared computer systems and on the finding of some fundamental properties which apply to the average number of customers in the system and the average response time functions for a large class of time shared computer systems The family of selfish scheduling algorithms is defined and the Laplace transform of the response time functions are obtained A family of scheduling algorithms whose performance ranges between that of the RR system and the FB system is constructed A simple relationship between the time dependent average number of customers in the system and the average response time functions for a large class of M/M/1 systems is formulated Finally some fundamental properties are established which apply to the average response time functions for all time shared computer systems Author

Performance Evaluation of Multiprogrammed Time-shared Computer Systems Akira Sekino, 1972 The report presents a comprehensive set of hierarchically organized modular analytical models developed for the performance evaluation of multiprogrammed virtual memory time shared computer systems using demand paging The hierarchy of models contains a user behavior model a secondary memory model a program behavior model a processor model and a total system model This thesis is particularly concerned with the last three models The program behavior model developed in this thesis permits one to estimate the frequency of paging expected on a given processing system The processor model enables one to evaluate the throughput of a given multi processor multi memory processing system under multiprogramming Finally the total system model allows us to derive the response time distribution of an entire computer system under study The report includes two PL/I programs Author *Naval Research Logistics Quarterly*, 1968 **NBS Special Publication**, 1973

Use of a Time-shared Computer System to Control a Hall Effect Experiment W. Murray Bullis, United States.

National Bureau of Standards,1969 An experimental time shared computer system has been used to control and collect data from a Hall effect experiment In addition to selection of the voltage sequence and control of specimen current and magnetic flux directions the computer exerts positive control over the specimen temperature in accordance with a series of thermocouple voltages entered by the operator at the beginning of the run The interface circuitry is constructed from four general purpose modules and a single special purpose unit Details of the interface system and the programs used to control the experiment and to perform intermediate calculations are given It was found that the time shared system was well suited to control an experiment of this type The demands on the computer were essentially similar to those required by a human user interacting in a conversational mode Substantial savings in time over manual data collection and reduction were realized a temperature run with 38 to 40 data points between 10 and 320 K could be completed in less than 4 hours
