Accidental Injury Biomechanics And Prevention:

Accidental Injury Alan M. Nahum, John W. Melvin, 2012-11-02 Writing on accidental injury often seems to occur from one of two perspectives One perspective is that of those involved in aspects of injury diagnosis and treatment and the other is that of those in the engineering and biologic sciences who discuss mechanical principles and simulations From our point of view significant information problems exist at the interface Persons in the business of diagnosis and treatment do not know how to access use and evaluate theoretical information that does not have obvious practical applications persons on the theoretical side do not have enough real life field data with which to identify problems or to evaluate solutions The ideal system provides a constant two way flow of data that permits continuous problem identification and course correction This book attempts to provide a state of the art look at the applied biomechanics of accidental injury causation and prevention The authors are recognized authorities in their specialized fields It is hoped that this book will stimulate more applied research in the field of accidental injury causation and prevention Alan M Nahum M D John W Melvin Ph D **Accidental Injury** Alan M. Niederer, Markus H. Muser, Felix Walz, 2013-04-09 The 2004 World Health Day is dedicated to the theme of road safety by the World Health Organization WHO due mostly to the enormous socio economic costs attributed to traffic accidents More than 140 000 people are injured 3 000 killed and 15 000 disabled for life everyday on the world's roads The field of trauma biomechanics or injury biomechanics uses the principles of mechanics to study the response and tolerance level of biological tissues under extreme loading conditions Through an understanding of mechanical factors that influence the function and structure of human tissues countermeasures can be developed to alleviate or even eliminate such injuries This book Trauma Biomechanics surveys a wide variety of topics in injury biomechanics including anatomy injury classification injury mechanism and injury criteria It is the first collection I am aware of that lists regional injury reference values or injury criterion either currently in use or proposed by both U S and European communities Although the book is meant to be an introduction for medical doctors and engineers who are beginners in the field of injury biomechanics sufficient references are provided for those who wish to conduct further research and even established researchers will find it useful as a reference for finding the biomechanical background of each proposed injury mechanism and injury criterion Rosen's Emergency Medicine -

Forensic Medicine of the Lower Extremity Jeremy Rich, Dorothy E. Dean, Robert H. Powers, 2007-10-28 Publius Syrus stated back in 42 B C You cannot put the same shoe on every foot Maxim 596 Though written long before the advent of forensic science Syrus maxim summarizes the theme of Forensic Medicine of the Lower Extremity Human Identification and Trauma Analysis of the Thigh Leg and Foot Put simply the lower extremity is a tremendously variable anatomic region This variation is beneficial to forensic experts Differences in the leg and foot can be used to establish individual identity Analysis of damage to the lower limb can be used to reconstruct antemortem perimortem and postmortem trauma As a forensic anthropologist I analyze cases involving decomposed burned mangled mutilated and skeletal remains Many of the corpses I examine are incomplete Occasionally I receive nothing but the legs and feet a lower torso dragged from a river a foot recovered in a city park dismembered drug dealers in plastic bags victims of bombings and airline disasters and the dead commingled in common graves Though the leg and foot contain much that is useful in forensic analysis before this publication investigators faced a twofold problem Little research that focused on the lower extremity was available in the literature and the existing research was published in diverse sources making its location and synthesis a daunting task

Trauma Biomechanics Kai-Uwe Schmitt, Peter F. Niederer, Markus H. Muser, Felix Walz, 2009-11-11 Injury is a leading cause of death hospitalisation and disability world wide The World Health Organization predicts that unintentional injuries arising from road traffic incidents will rise to take third place in the rank order of international disease burden by the year 2030 Although these statistics and the associated economic costs are staggering the effect of unintentional injury and death from trauma is more apparent and more disturbing when seen personally By a young age

nearly everyone in the world regardless of region wealth or education has had a relative or someone that they know killed or disabled in an accident The quality of life and financial effects on the injured person and their families and friends are plainly evident and clearly devastating Many unintentional injuries are in reality not accidents they could be prevented with changes in policy education or through improved safety devices Arrayed against these preventable injuries a diverse group of injury prevention researchers and practitioners work to decrease the incidence of unintentional injury In trauma biomechanics the principles of mechanics are used to understand how injuries happen at the level of the bones joints organs and tissues of the body This knowledge is central in the development characterization and improvement of safety devices such as helmets and seat belts and in the safe design of vehicles and equipment used for transportation occupation and recreation
